2. Absolute Maximum Ratings

Items	Symbol	Values		Unit	Condition
		Min.	Max.		
Power Voltage	VCI / VDDIO	-0.3	4	V	
LED Reverse Voltage	Vr		5	V	One LED
LED Forward Current	If		22	mA	One LED, Note 2

Note 1. If the operating condition exceeds the absolute maximum ratings, the TFT-LCD module may be damaged permanently. Also, if the module operated with the absolute maximum ratings for a long time, its reliability may drop.

Note 2. If LED current exceeds the limit curve, the lifetime will drop dramatically.

	Y	$\theta=0^\circ$	0.290	0.340	0.390		

Note 1. Ambient temperature =25°C.

Note 2. To be measured in the dark room.

Note 3. To be measured on the center area of panel with a field angle of 1° by Topcon luminance meter BM-5A, after 10 minutes operation.

Note 4. Definition of response time:

The output signals of photo detector are measured when the input signals are changed from “black” to “white”(falling time) and from “white” to “black”(rising time), respectively.

The response time is defined as the time interval between the 10% and 90% of amplitudes. Refer to figure as below.

Note 5. Definition of contrast ratio:

Contrast ratio is calculated with the following formula.

$$\text{Contrast ratio (CR)} = \frac{\text{Photo detector output when LCD is at "White" state}}{\text{Photo detector output when LCD is at "Black" state}}$$

Note 6. White $V_i = V_{i50} \overset{\bar{+}}{+} 1.5V$

Black $V_i = V_{i50} \pm 2.0V$

" \pm " Means that the analog input signal swings in phase with COM signal.

" $\bar{+}$ " Means that the analog input signal swings out of phase with COM signal.

V_{i50} : The analog input voltage when transmission is 50%

The 100% transmission is defined as the transmission of LCD panel when all the input terminals of module are electrically opened.

Note 7. Definition of viewing angle, Φ , Refer to figure as below.

Note 8. Measured at the center area of the panel in gray level 255

Note 9. Color Filter Arrangement

4. Attention

Please pay attention for below matters at mounting design of touch panel of LCD module.

1. Do not design enclosure pressing the view area to prevent from miss input.
2. Enclosure support must not touch with view area.
3. Use elastic or non-conductive material to enclosure touch panel.
4. Do not bond film of touch panel with enclosure.
5. The touch panel edge is conductive. Do not touch it with any conductive part after mounting.
6. If user wants to cleaning touch panel by air gun, pressure 2kg/cm² below is suggested. Not to blow glass from FPC site to prevent FPC peeled off.
7. Do not put a heavy shock or stress on touch panel and film surface. Ex. Don't lift the panel by film face

with vacuum.

8. Do not lift LCD module by FPC.
9. Please use dry cloth or soft cloth with neutral detergent (after wring dry) or one with ethanol at cleaning. Do not use any organic solvent, acid or alkali liquor.
10. Do not pile touch panel. Do not put heavy goods on touch panel.
11. In order to get the optimal mapping between TFT-LCD and Touch Panel, each touch panel needs to be executed calibration (5 points at least) before operating touch functions..For detail calibration algorithms, please refer to touch panel driving IC user manuals.
12. The visible newton ring appearance on the surface of touch panel is predictable since the low activation force request.

- 3: When enters into standby mode, The minimum cycle time of VDD OFF is 6 frames.

3. Suggested Circuit

The suggested circuit and recommended capacitor specification are both showed as follows. Please refer to the design for better display quality.

4. Input Data Timing

When SEL = "000" HV mode without dummy is selected, the input data RGB sequence should match the setting of SHL in R1.

When SHL = '1', the RGB sequence of input data is "R data" -> "G data" -> "B data".

When SHL = '0', the RGB sequence of input data is "B data" -> "G data" -> "R data".

The illustration is shown as below:

- ❖ SHL = '1', H shift direction = left to right.

- ❖ SHL = '0', H shift direction = right to left.
