# AM572x Sitara™ Processors

## Silicon Revision 2.0

---

## 1 Device Overview

### 1.1 Features

- Dual Arm® Cortex®-A15 microprocessor subsystem
- Up to 2 C66x floating-point VLIW DSP
  - Fully object-code compatible with C67x and C64x+
  - Up to thirty-two 16 × 16-bit fixed-point multiplies per cycle
- Up to 2.5MB of on-chip L3 RAM
- Two DDR3/DDR3L memory interface (EMIF) modules
  - Supports up to DDR3-1066
  - Up to 2GB supported per EMIF
- 2x dual Arm® Cortex®-M4 co-processors (IPU1 and IPU2)
- Up to four Embedded Vision Engines (EVEs)
- IVA-HD subsystem
  - 4K @ 15fps encode and decode support for H.264 CODEC
  - Other CODECs are up to 1080p60
- Display subsystem
  - Full-HD video (1920 × 1080p, 60 fps)
  - Multiple video input and video output
  - 2D and 3D graphics
  - Display controller with DMA engine and up to three pipelines
  - HDMI® encoder: HDMI 1.4a and DVI 1.0 compliant
- 2x dual-core Programmable Real-Time Unit and Industrial Communication SubSystem (PRU-ICSS)
- 2D-graphics accelerator (BB2D) subsystem
  - Vivante® GC320 core
- Video Processing Engine (VPE)
- Dual-core PowerVR® SGX544™ 3D GPU
- Crypto hardware accelerators
  - AES, SHA, RNG, DES and 3DES
- Three video Input Port (VIP) modules
- General-Purpose Memory Controller (GPMC)
- Enhanced Direct Memory Access (EDMA) controller
- 2-port gigabit ethernet (GMAC)
- Sixteen 32-bit general-purpose timers
- 32-bit MPU watchdog timer
- Five Inter-Integrated Circuit ( I<sup>2</sup>C™) ports
- HDQ™/ 1-Wire® interface
- Ten configurable UART/IrDA/CIR modules
- Four Multichannel Serial Peripheral Interfaces (McSPI)
- Quad SPI interface (QSPI)
- SATA gen2 interface
- Eight Multichannel Audio Serial Port (McASP) modules
- SuperSpeed USB 3.0 dual-role device
- High-speed USB 2.0 dual-role device
- Four Multimedia Card/Secure Digital/Secure Digital Input Output interfaces ( MMC™/ SD®/SDIO)
- PCI-Express® 3.0 subsystems with two 5-Gbps lanes
  - One 2-lane gen2-compliant port
  - or two 1-lane gen2-compliant ports
- Dual Controller Area Network (DCAN) modules
  - CAN 2.0B protocol
- Up to 247 General-Purpose I/O (GPIO) pins
- Power, Reset, and Clock Management (PRCM)
- On-chip debug with CTools technology
- 28-nm CMOS technology
- 23 mm × 23 mm, 0.8-mm pitch, 760-pin BGA (ABC)

## 1.2 Applications

- Industrial communication
- Human Machine Interface (HMI)
- Automation and control
- High performance applications
- Analytics
- Other general use

## 1.3 Description

AM572x Sitara™ processors are Arm applications processors built to meet the intense processing needs of modern embedded products.

AM572x devices bring high processing performance through the maximum flexibility of a fully integrated mixed processor solution. The devices also combine programmable video processing with a highly integrated peripheral set. Cryptographic acceleration is available in every AM572x device.

Programmability is provided by dual-core Arm® Cortex®-A15 RISC CPUs with Arm® Neon™ extension, and two TI C66x VLIW floating-point DSP core, and Vision AccelerationPac (with 4x EVEs). The Arm allows developers to keep control functions separate from other algorithms programmed on the DSPs and coprocessors, thus reducing the complexity of the system software.

Additionally, TI provides a complete set of development tools for the Arm and C66x DSP, including C compilers, a DSP assembly optimizer to simplify programming and scheduling, and a debugging interface for visibility into source code execution.

**Device Information<sup>(1)</sup>**

| PART NUMBER | PACKAGE     | BODY SIZE         |
|-------------|-------------|-------------------|
| AM5729ABC   | FCBGA (760) | 23.0 mm × 23.0 mm |
| AM5728ABC   | FCBGA (760) | 23.0 mm × 23.0 mm |
| AM5726ABC   | FCBGA (760) | 23.0 mm × 23.0 mm |

- (1) Features noted as “not supported,” must not be used. Their functionality is not supported by TI for this family of devices. These features are subject to removal without notice on future device revisions. Any information regarding the unsupported features has been retained in the documentation solely for the purpose of clarifying signal names or for consistency with previous feature descriptions.
- (2) In the Unified L3 memory map, there is maximum of 2GB of SDRAM space which is available to all L3 initiators including MPU (MPU, GPU, DSP, IVA, DMA, etc). Typically this space is interleaved across both EMIFs to optimize memory performance. If a system populates > 2GB of physical memory, that additional addressable space can be accessed only by the MPU via the Arm V7 Large Physical Address Extensions (LPAE).
- (3) MLB power rails (vdds\_mlbp) must be connected to a 1.8V power supply even this feature is not supported.
- (4) RTC only mode is not supported feature.
- (5) For more details about the CTRL\_WKUP\_STD\_FUSE\_DIE\_ID\_2 register and Base PN bitfield, see the *AM572x Sitara™ Processors Silicon Revision 2.0, 1.1* (SPRUHZ6).
- (6) The Embedded Vision Engine (EVE) consumes additional power when enabled. Therefore all designs using the AM5729 device must implement the TPS6590379ZWSR PMIC which provides a separate SMPS output for vdd\_dspeve. Please refer to the *TPS659037 User's Guide to Power AM574x, AM572x, and AM571x* (SLIU011) for more information. Be sure to use the [Power Estimation Tool \(PET\)](#) to correctly size your system thermal solution.

### 3.1 Related Products

**Sitara Processors** Scalable processors based on Arm® Cortex®-A cores with flexible peripherals, connectivity & unified software support – perfect for sensors to servers.

**TI's Arm Cortex-A15 Advantage** The Arm Cortex-A15 processor is proven in a range of different markets and is an increasingly popular choice in networking infrastructure, delivering high-performance processing capability combined with low power consumption. The Cortex-A15 processor delivers roughly twice the performance of the Cortex-A9 processor and can achieve 3.5 DMIPS/MHz.

**Sitara Applications** Sitara™ processors provide scalable solutions for a wide range of applications from HMI and gateways to more complex equipment such as drives and substation automation equipment. Sitara Arm® processors offer scalability and reliability as well as multi-protocol support for industrial communication protocols such as EtherCAT, Ethernet/IP and Profinet.

**Reference Designs** TI provides many reference designs containing ‘building block’ solutions to enable customers to rapidly development of their unique products and solutions.

## 4 Terminal Configuration and Functions

### 4.1 Terminal Assignment

Figure 4-1 shows the ball locations for the 760 plastic ball grid array (PBGA) package and are used in conjunction with Table 4-2 through Table 4-34 to locate signal names and ball grid numbers.

Figure 4-1. ABC S-PBGA-N760 Package (Bottom View)

**NOTE**

The following bottom balls are not connected: AF7 / AF10 / AF13 / AF16 / AF19 / AE4 / AE25 / AB26 / W3 / W26 / T3 / T26 / N3 / N26 / K3 / K26 / G3 / D4 / D25 / C10 / C13 / C16 / C19 / C22.

These balls do not exist on the package.

#### 4.1.1 Unused Balls Connection Requirements

This section describes the Unused/Reserved balls connection requirements.

**NOTE**

The following balls are reserved: Y5 / Y10 / K14 / B28 / A27

These balls must be left unconnected.

**NOTE**

All unused power supply balls must be supplied with the voltages specified in the Section 5.4, Recommended Operating Conditions, unless alternative tie-off options are included in Section 4.4, Signal Descriptions.

Table 4-1. Unused Balls Specific Connection Requirements

| BALLS   | CONNECTION REQUIREMENTS  |
|---|--|
| AE14 / AE15 / AD17 / AC15 / AC16 / AC17 / AB16 / V27 / D20 / AH25 / AE27 / AD27 / Y28 / G28 / H27 / K27 / M28 | These balls must be connected to GND through an external pull resistor if unused |

**Table 4-1. Unused Balls Specific Connection Requirements (continued)**

| BALLS  | CONNECTION REQUIREMENTS  |
|--|--|
| V28 / F18 / E20 / E23 / D21 / C20 / C21 / AG25 / AE28 / AD28 / Y27 / G27 / H28 / K28 / M27 / F17 / C25 | These balls must be connected to the corresponding power supply through an external pull resistor if unused  |
| AF14 (rtc_iso)   | This ball should be connected to the corresponding power supply through an external pull resistor if unused; or can be connected to F22 (porz) when RTC unused (level translation may be needed) |
| AB17 (rtc_porz)  | This ball should be connected to VSS when RTC is unused; or can be connected to F22 (porz) when RTC unused (level translation may be needed)   |

**NOTE**

All other unused signal balls **with** a Pad Configuration Register can be left unconnected with their internal pullup or pulldown resistor enabled.

**NOTE**

All other unused signal balls **without** Pad Configuration Register can be left unconnected.

**4.2 Ball Characteristics**

Table 4-2 describes the terminal characteristics and the signals multiplexed on each ball. The following list describes the table column headers:

- BALL NUMBER:** Ball number(s) on the bottom side associated with each signal on the bottom.
- BALL NAME:** Mechanical name from package device (name is taken from muxmode 0).
- SIGNAL NAME:** Names of signals multiplexed on each ball (also notice that the name of the ball is the signal name in muxmode 0).

**NOTE**

Table 4-2 does not consider the subsystem multiplexing signals. Subsystem multiplexing signals are described in Section 4.4, *Signal Descriptions*.

**NOTE**

In the Driver off mode, the buffer is configured in high-impedance.

- PN:** This column shows if the functionality is applicable for **AM5726** device. Note that the Ball Characteristics table presents a functionality of super set. If the cell is empty it means that the signal is available in all devices.
  - **Yes** - Functionality is presented in **AM5726**
  - **No** - Functionality is not presented in **AM5726**
 An empty box means Yes.
- MUXMODE:** Multiplexing mode number:
  - MUXMODE 0 is the primary muxmode; this means that when MUXMODE=0, the function mapped on the pin corresponds to the name of the pin. The primary muxmode is not necessarily the default muxmode.

**NOTE**

The default muxmode is the mode at the release of the reset; also see the RESET REL. MUXMODE column.

- MUXMODE 1 through 15 are possible muxmodes for alternate functions. On each pin, some

muxmodes are effectively used for alternate functions, while some muxmodes are not used. Only MUXMODE values which correspond to defined functions should be used.

c. An empty box means Not Applicable.

6. **TYPE:** Signal type and direction:

- I = Input
- O = Output
- IO = Input or Output
- D = Open drain
- DS = Differential Signaling
- A = Analog
- PWR = Power
- GND = Ground
- CAP = LDO Capacitor

---

**NOTE**

The RX buffer within the pad logic should be disabled on all pins that are not being used as an input. For more information, see the *Control Module / Control Module Functional Description / PAD Functional Multiplexing and Configuration* section in the device TRM.

---

7. **BALL RESET STATE:** The state of the terminal at power-on reset:

- drive 0 (OFF): The buffer drives  $V_{OL}$  (pulldown or pullup resistor not activated).
- drive 1 (OFF): The buffer drives  $V_{OH}$  (pulldown or pullup resistor not activated).
- OFF: High-impedance
- PD: High-impedance with an active pulldown resistor
- PU: High-impedance with an active pullup resistor
- An empty box means Not Applicable

---

**NOTE**

Designs that contain pullup or pulldown resistors, either on the board or in attached devices that oppose internal pullup or pulldown resistors, that are active while the device is held in reset, must not remain in reset for long periods of time.

---

8. **BALL RESET REL. STATE:** The state of the terminal at the deactivation of the rstoutn signal (also mapped to the PRCM SYS\_WARM\_OUT\_RST signal).

- drive 0 (OFF): The buffer drives  $V_{OL}$  (pulldown or pullup resistor not activated).
- drive clk (OFF): The buffer drives a toggling clock (pulldown or pullup resistor not activated).
- drive 1 (OFF): The buffer drives  $V_{OH}$  (pulldown or pullup resistor not activated).
- OFF: High-impedance
- PD: High-impedance with an active pulldown resistor
- PU: High-impedance with an active pullup resistor
- An empty box means Not Applicable

---

**NOTE**

For more information on the CORE\_PWRON\_RET\_RST reset signal and its reset sources, see the Power Reset and Clock Management / PRCM Reset Management Functional Description section of the Device TRM.

---

9. **BALL RESET REL. MUXMODE:** This muxmode is automatically configured at the release of the rstoutn signal (also mapped to the PRCM SYS\_WARM\_OUT\_RST signal).  
An empty box means Not Applicable.

10. **I/O VOLTAGE VALUE:** This column describes the IO voltage value (VDDS supply).  
An empty box means Not Applicable.

11. **POWER:** The voltage supply that powers the terminal IO buffers.  
An empty box means Not Applicable.
12. **HYS:** Indicates if the input buffer is with hysteresis:
- Yes: With hysteresis
  - No: Without hysteresis
  - An empty box: Not Applicable

**NOTE**

For more information, see the hysteresis values in [Section 5.7, Electrical Characteristics](#).

13. **BUFFER TYPE:** Drive strength of the associated output buffer.  
An empty box means Not Applicable.

**NOTE**

For programmable buffer strength:

- The default value is given in [Table 4-2](#).
- A note describes all possible values according to the selected muxmode.

14. **PULLUP / PULLDOWN TYPE:** Denotes the presence of an internal pullup or pulldown resistor. Pullup and pulldown resistors can be enabled or disabled via software.
- PU: Internal pullup
  - PD: Internal pulldown
  - PU/PD: Internal pullup and pulldown
  - PUx/PDy: Programmable internal pullup and pulldown
  - PDy: Programmable internal pulldown
  - An empty box means No pull

**NOTE**

Internal pullup or pulldown resistors must be disabled when opposed by an external pullup or pulldown resistor on the board or within an attached device.

15. **DSIS:** The deselected input state (DSIS) indicates the state driven on the peripheral input (logic "0", logic "1", or "PIN" level) when the peripheral pin function is not selected by any of the PINCNTLx registers.
- 0: Logic 0 driven on the peripheral's input signal port.
  - 1: Logic 1 driven on the peripheral's input signal port.
  - blank: Pin state driven on the peripheral's input signal port.

**NOTE**

Configuring two pins to the same input signal is not supported as it can yield unexpected results. This can be easily prevented with the proper software configuration (Hi-Z mode is not an input signal).

**NOTE**

When a pad is set into a multiplexing mode which is not defined by pin multiplexing, that pad's behavior is undefined. This should be avoided.

**CAUTION**

Not all exposed peripherals are supported on all AM572x devices. For peripherals supported on specific device from AM572x family of products refer to [Table 3-1](#), Device Comparison Table.

**NOTE**

Some of the DDR1 and DDR2 signals have an additional state change at the release of porz. The state that the signals change to at the release of porz is as follows:

drive 0 (OFF) for: ddr1\_csn0, ddr1\_ck, ddr1\_nck, ddr1\_casn, ddr1\_rasn, ddr1\_wen, ddr1\_ba[2:0], ddr1\_a[15:0], ddr2\_csn0, ddr2\_ck, ddr2\_nck, ddr2\_casn, ddr2\_rasn, ddr2\_wen, ddr2\_ba[2:0], ddr2\_a[15:0].

OFF for: ddr1\_ecc\_d[7:0], ddr1\_dqm[3:0], ddr1\_dqm\_ecc, ddr1\_dqs[3:0], ddr1\_dqsn[3:0], ddr1\_dqs\_ecc, ddr1\_dqsn\_ecc, ddr1\_d[31:0], ddr2\_dqm[3:0], ddr2\_dqs[3:0], ddr2\_dqsn[3:0], ddr2\_d[31:0].

- (1) NA in this table stands for Not Applicable.
- (2) For more information on recommended operating conditions, see [Table 5-4, Recommended Operating Conditions](#).
- (3) The pullup or pulldown block strength is equal to: minimum = 50  $\mu$ A, typical = 100  $\mu$ A, maximum = 250  $\mu$ A.
- (4) The output impedance settings of this IO cell are programmable; by default, the value is DS[1:0] = 10, this means 40  $\Omega$ . For more information on DS[1:0] register configuration, see the Device TRM.
- (5) IO drive strength for usb1\_dp, usb1\_dm, usb2\_dp and usb2\_dm: minimum 18.3 mA, maximum 89 mA (for a power supply vdda33v\_usb1 and vdda33v\_usb2 = 3.46 V).
- (6) Minimum PU = 900  $\Omega$ , maximum PU = 3.090 k $\Omega$  and minimum PD = 14.25 k $\Omega$ , maximum PD = 24.8 k $\Omega$ . For more information, see chapter 7 of the USB2.0 specification, in particular section Signaling / Device Speed Identification.
- (7) In PUX / PDy, x and y = 60 to 200  $\mu$ A. The output impedance settings (or drive strengths) of this IO are programmable (34  $\Omega$ , 40  $\Omega$ , 48  $\Omega$ , 60  $\Omega$ , 80  $\Omega$ ) depending on the values of the I[2:0] registers.
- (8) The VOUT3 interface when multiplexed onto balls mapped to the VDDSHV6 supply rail is restricted to operating in 1.8V mode only (VDDSHV6 must be supplied with 1.8V). 3.3V mode is not supported. This must be considered in the pin mux programming and VDDSHVx supply connections.
- (9) The internal pull resistors for balls K7, M7, J5, K6, J4, J6, H4, H5 are permanently disabled when sysboot15 is set to 1 as described in the section *Sysboot Configuration* of the Device TRM. If internal pull-up/down resistors are desired on these balls then sysboot15 should be set to 0. If gpmc boot mode is used with SYSBOOT15=1 (not recommended) then external pull-downs should be implemented to keep the address bus at logic-0 value during boot since the gpmc ms-address bits are high-z during boot.

### 4.3 Multiplexing Characteristics

[Table 4-3](#) describes the device multiplexing (no characteristics are available in this table).

#### NOTE

This table doesn't take into account subsystem multiplexing signals. Subsystem multiplexing signals are described in [Section 4.4, Signal Descriptions](#).

**NOTE**

For more information, see the Control Module / Control Module Functional Description / PAD Functional Multiplexing and Configuration section of the Device TRM.

**NOTE**

Configuring two pins to the same input signal is not supported as it can yield unexpected results. This can be easily prevented with the proper software configuration (Hi-Z mode is not an input signal).

**NOTE**

When a pad is set into a multiplexing mode which is not defined by pin multiplexing, that pad's behavior is undefined. This should be avoided.

**CAUTION**

The I/O timings provided in [Section 7, Timing Requirements and Switching Characteristics](#) are valid only if signals within a single IOSET are used. The IOSETs are defined in the corresponding tables.

## 4.4 Signal Descriptions

Many signals are available on multiple pins, according to the software configuration of the pin multiplexing options.

Texas Instruments has developed an application called Pin Mux Utility that helps a system designer select the appropriate pin-multiplexing configuration for their device-based product design. The Pin Mux Utility provides a way to select valid IO Sets of specific peripheral interfaces to ensure the pinmultiplexing configuration selected for a design only uses valid IO Sets supported by the device.

1. **SIGNAL NAME:** The name of the signal passing through the pin.

### NOTE

The subsystem multiplexing signals are not described in [Table 4-2](#) and [Table 4-3](#).

2. **DESCRIPTION:** Description of the signal

3. **TYPE:** Signal direction and type:

- I = Input
- O = Output
- IO = Input or output
- D = Open Drain
- DS = Differential
- A = Analog
- PWR = Power
- GND = Ground

4. **BALL:** Associated ball(s) bottom

### NOTE

For more information, see the Control Module / Control Module Register Manual section of the device TRM.

### 4.4.1 Video Input Port (VIP)

#### CAUTION

The I/O timings provided in [Section 7, Timing Requirements and Switching Characteristics](#) are applicable for all combinations of signals for vin1, vin5 and vin6. However, the timings are valid only for vin2, vin3, and vin4 if signals within a single IOSET are used. The IOSETs are defined in the [Table 7-4](#).

### NOTE

For more information, see the Video Input Port (VIP) section of the device TRM.

#### 4.4.2 Display Subsystem – Video Output Ports

**CAUTION**

The I/O timings provided in [Section 7, Timing Requirements and Switching Characteristics](#) are valid only if signals within a single IOSET are used. The IOSETs are defined in the [Table 7-19](#) and [Table 7-20](#).

(1) The VOUT3 interface when multiplexed onto balls mapped to the VDDSHV6 supply rail is restricted to operating in 1.8V mode only (VDDSHV6 must be supplied with 1.8V). 3.3V mode is not supported. This must be considered in the pin mux programming and VDDSHVx supply connections.

- (1) This clock signal is implemented as 'pad loopback' inside the device - the output signal is looped back through the input buffer to serve as the internal reference signal. Series termination is recommended (as close to device pin as possible) to improve signal integrity of the clock input. Any nonmonotonicity in voltage that occurs at the pad loopback clock pin between  $V_{IH}$  and  $V_{IL}$  must be less than  $V_{HYS}$ .
- (2) The gpio6\_16.clkout1 signal can be used as an "always-on" alternative to gpmc\_clk provided that the external device can support the associated timing. See [Table 7-26 GPMC/NOR Flash Interface Switching Characteristics - Synchronous Mode - Default](#) and [Table 7-28 GPMC/NOR Flash Interface Switching Characteristics - Synchronous Mode - Alternate](#) for timing information.
- (3) The internal pull resistors for balls K7, M7, J5, K6, J4, J6, H4, H5 are permanently disabled when sysboot15 is set to 1 as described in the section *Sysboot Configuration* of the Device TRM. If internal pull-up/down resistors are desired on these balls then sysboot15 should be set to 0. If gpmc boot mode is used with SYSBOOT15=1 (not recommended) then external pull-downs should be implemented to keep the address bus at logic-0 value during boot since the gpmc ms-address bits are high-z during boot.

#### 4.4.10 Multichannel Serial Peripheral Interface (McSPI)

##### CAUTION

The I/O timings provided in [Section 7, Timing Requirements and Switching Characteristics](#) are applicable for all combinations of signals for SPI1 and SPI2. However, the timings are valid only for SPI3 and SPI4 if signals within a single IOSET are used. The IOSETS are defined in the [Table 7-45](#).

##### NOTE

For more information, see the Serial Communication Interface / Multichannel Serial Peripheral Interface (McSPI) section of the device TRM.

(1) This clock signal is implemented as 'pad loopback' inside the device - the output signal is looped back through the input buffer to serve as the internal reference signal. Series termination is recommended (as close to device pin as possible) to improve signal integrity of the clock input. Any nonmonotonicity in voltage that occurs at the pad loopback clock pin between  $V_{IH}$  and  $V_{IL}$  must be less than  $V_{HYS}$ .

#### 4.4.11 Quad Serial Peripheral Interface (QSPI)

##### NOTE

For more information see the Serial Communication Interface / Quad Serial Peripheral Interface section of the device TRM.

**Table 4-14. QSPI Signal Descriptions**

| SIGNAL NAME | DESCRIPTION   | TYPE | BALL |
|-------------|---|------|------|
| qspi1_sclk  | QSPI1 Serial Clock  | O    | R2   |
| qspi1_rtclk | QSPI1 Return Clock Input. Must be connected from QSPI1_SCLK on PCB. Refer to PCB Guidelines for QSPI1.  | I    | R3   |
| qspi1_d0    | QSPI1 Data[0]. This pin is output data for all commands/writes and for dual read and quad read modes it becomes input data pin during read phase. | IO   | U1   |
| qspi1_d1    | QSPI1 Data[1]. Input read data in all modes.  | I    | P3   |
| qspi1_d2    | QSPI1 Data[2]. This pin is used only in quad read mode as input data pin during read phase  | I    | U2   |
| qspi1_d3    | QSPI1 Data[3]. This pin is used only in quad read mode as input data pin during read phase  | I    | T2   |
| qspi1_cs0   | QSPI1 Chip Select[0]. This pin is Used for QSPI1 boot modes.  | O    | P2   |
| qspi1_cs1   | QSPI1 Chip Select[1]  | O    | P1   |
| qspi1_cs2   | QSPI1 Chip Select[2]  | O    | T7   |
| qspi1_cs3   | QSPI1 Chip Select[3]  | O    | P6   |

(1) This clock signal is implemented as 'pad loopback' inside the device - the output signal is looped back through the input buffer to serve as the internal reference signal. Series termination is recommended (as close to device pin as possible) to improve signal integrity of the clock input. Any nonmonotonicity in voltage that occurs at the pad loopback clock pin between  $V_{IH}$  and  $V_{IL}$  must be less than  $V_{HYS}$ .

#### 4.4.17 Ethernet Interface (GMAC\_SW)

##### CAUTION

The I/O timings provided in [Section 7, Timing Requirements and Switching Characteristics](#) are valid only if signals within a single IOSET are used. The IOSETs are defined in the [Table 7-72](#), [Table 7-75](#), [Table 7-80](#) and [Table 7-87](#).

**NOTE**

For more information, see the Serial Communication Interfaces / Ethernet Controller section of the device TRM.

(1) By default, this clock signal is implemented as 'pad loopback' inside the device - the output signal is looped back through the input buffer to serve as the internal reference signal. mmc1\_clk and mmc2\_clk have an optional software programmable setting to use an 'internal loopback clock' instead of the default 'pad loopback clock'. If the 'pad loopback clock' is used, series termination is recommended (as close to device pin as possible) to improve signal integrity of the clock input. Any nonmonotonicity in voltage that occurs at the pad loopback clock pin between  $V_{IH}$  and  $V_{IL}$  must be less than  $V_{HYS}$ .

(1) gpio8\_30 is multiplexed with EMU0 and gpio8\_31 is multiplexed with EMU1. These pins will be sampled at reset release by the test and emulation logic. Therefore, if they are used as GPIO pins, they must return to the high state whenever the device enters reset. This can be controlled by logic driven from rstoutn. After the device exits reset (indicated by rstoutn rising), these can return to GPIO mode.

#### 4.4.23 Programmable Real-Time Unit Subsystem and Industrial Communication Subsystem (PRU-ICSS)

##### CAUTION

The I/O timings provided in [Section 7, Timing Requirements and Switching Characteristics](#) are valid only if signals within a single IOSET are used. The IOSETs are defined in the [Table 7-154](#) and [Table 7-155](#).

##### NOTE

For more information see the Programmable Real-Time Unit Subsystem and Industrial Communication Subsystem section of the device TRM.

PRU-ICSS has internal multiplexing capability of pin functions. See *PRU-ICSS EGPIO Internal Pinmux* in device TRM. Besides, EGPIO module can be configured to export additional functions to EGPIO pins in place of simple GPIO. See *Enhanced General-Purpose Module/Serial Capture Unit* in device TRM.

#### 4.4.24 Test Interfaces

##### CAUTION

The I/O timings provided in [Section 7, Timing Requirements and Switching Characteristics](#) are valid only if signals within a single IOSET are used. The IOSETs are defined in the [Table 7-179](#).

##### NOTE

For more information, see the On-Chip Debug Support / Debug Ports section of the device TRM.

(1) EMU0 and EMU1 are multiplexed with GPIO. These pins will be sampled at reset release by the test and emulation logic. Therefore, if they are used as GPIO pins, they must return to the high state whenever the device enters reset. This can be controlled by logic driven from rstoutn. After the device exits reset (indicated by rstoutn rising), these can return to GPIO mode.

| xref_clk3                      | External Reference Clock 3. For Audio and other Peripherals.  | I    | C23     |
| xi_osc0                        | System Oscillator OSC0 Crystal input / LVCMOS clock input. Functions as the input connection to a crystal when the internal oscillator OSC0 is used. Functions as an LVCMOS-compatible input clock when an external oscillator is used.   | I    | AE15    |
| xo_osc0                        | System Oscillator OSC0 Crystal output   | O    | AD15    |
| xi_osc1                        | Auxiliary Oscillator OSC1 Crystal input / LVCMOS clock input. Functions as the input connection to a crystal when the internal oscillator OSC1 is used. Functions as an LVCMOS-compatible input clock when an external oscillator is used | I    | AC15    |
| xo_osc1                        | Auxiliary Oscillator OSC1 Crystal output  | O    | AC13    |
| RMII_MHZ_50_CLK <sup>(1)</sup> | RMII Reference Clock (50MHz). This pin is an input when external reference is used or output when internal reference is used.   | IO   | U3      |

(1) This clock signal is implemented as 'pad loopback' inside the device - the output signal is looped back through the input buffer to serve as the internal reference signal. Series termination is recommended (as close to device pin as possible) to improve signal integrity of the clock input. Any nonmonotonicity in voltage that occurs at the pad loopback clock pin between  $V_{IH}$  and  $V_{IL}$  must be less than  $V_{HYS}$ .

(2) Note that rstoutn is only valid after vddshv3 is valid. If the rstoutn signal will be used as a reset into other devices attached to the SOC, it must be AND'ed with porz. This will prevent glitches occurring during supply ramping being propagated.

#### 4.4.25.3 Real-Time Clock (RTC) Interface

---

##### NOTE

For more information, see the Real-Time Clock (RTC) chapter of the device TRM.

---

##### NOTE

RTC only mode is not supported feature.

---

**Table 4-30. RTC Signal Descriptions**

| SIGNAL NAME            | DESCRIPTION   | TYPE | BALL |
|------------------------|---|------|------|
| Wakeup0                | RTC External Wakeup Input 0   | I    | AD17 |
| Wakeup1                | RTC External Wakeup Input 1   | I    | AC17 |
| Wakeup2                | RTC External Wakeup Input 2   | I    | AB16 |
| Wakeup3                | RTC External Wakeup Input 3   | I    | AC16 |
| rtc_porz               | RTC Power Domain Power-On Reset Input   | I    | AB17 |
| rtc_osc_xi_clkin32     | RTC Oscillator Input. Crystal connection to internal RTC oscillator. Functions as an RTC clock input when an external oscillator is used. | I    | AE14 |
| rtc_osc_xo             | RTC Oscillator Output   | O    | AD14 |
| rtc_iso <sup>(1)</sup> | RTC Domain Isolation Signal   | I    | AF14 |
| on_off                 | RTC Power Enable output pin   | O    | Y11  |

- (1) This signal must be kept 0 if device power supplies are not valid during RTC mode and 1 during normal operation. This can typically be achieved by connecting `rtc_iso` to the same signal driving `porz` (not `rtc_porz`) with appropriate voltage level translation if necessary.

#### 4.4.25.4 System Direct Memory Access (SDMA)

**NOTE**

For more information, see the DMA Controllers / System DMA section of the device TRM.

**Table 4-31. System DMA Signal Descriptions**

| SIGNAL NAME           | DESCRIPTION              | TYPE | BALL   |

#### 4.4.25.5 Interrupt Controllers (INTC)

**NOTE**

For more information, see the Interrupt Controllers chapter of the device TRM.

**Table 4-32. INTC Signal Descriptions**

| SIGNAL NAME            | DESCRIPTION  | TYPE | BALL |
|------------------------|--|------|------|
| <code>nmin_dsp</code>  | Non maskable interrupt input, active-low. This pin can be optionally routed to the DSP NMI input or as generic input to the Arm cores. Note that by default this pin has an internal pulldown resistor enabled. This internal pulldown should be disabled or countered by a stronger external pullup resistor before routing to the DSP or Arm processors. | I    | D21  |
| <code>sys_nirq2</code> | External interrupt event to any device INTC  | I    | AB16 |
| <code>sys_nirq1</code> | External interrupt event to any device INTC  | I    | AC16 |

## 5 Specifications

### NOTE

For more information, see Power, Reset, and Clock Management / PRCM Subsystem Environment / External Voltage Inputs or Initialization / Preinitialization / Power Requirements section of the Device TRM.

### NOTE

The index numbers 1 and 2 which is part of the EMIF1 and EMIF2 signal prefixes (ddr1\_\* and ddr2\_\*) listed in [Table 4-7](#), *EMIF Signal Descriptions*, column "SIGNAL NAME" not to be confused with DDR1 and DDR2 types of SDRAM memories.

### NOTE

Audio Back End (ABE) module is not supported for this family of devices, but "ABE" name is still present in some clock or DPLL names.

### CAUTION

All IO Cells are NOT Fail-safe compliant and should not be externally driven in absence of their IO supply.

### 5.1 Absolute Maximum Ratings

Stresses beyond those listed as absolute maximum ratings may cause permanent damage to the device. These are stress ratings only, and functional operation of the device at these or any other conditions beyond those listed under [Section 5.4](#), *Recommended Operating Conditions*, is not implied. Exposure to absolute maximum rated conditions for extended periods may affect device reliability.

- (1) See I/Os supplied by this power pin in [Table 4-2 Ball Characteristics](#)
- (2) VDD is the voltage on the corresponding power-supply pin(s) for the I/O.
- (3) Per JEDEC JESD78 at 125°C with specified I/O pin injection current and clamp voltage of 1.5 times maximum recommended I/O voltage and negative 0.5 times maximum recommended I/O voltage.
- (4) Per JEDEC JESD78 at 125°C.
- (5) The maximum valid input voltage on an IO pin cannot exceed 0.3 volts when the supply powering the IO is turned off. This requirement applies to all the IO pins which are not fail-safe and for all values of IO supply voltage. Special attention should be applied anytime peripheral devices are not powered from the same power sources used to power the respective IO supply. It is important the attached peripheral never sources a voltage outside the valid input voltage range, including power supply ramp-up and ramp-down sequences.

## 5.2 ESD Ratings

**Table 5-2. ESD Ratings**

|                    |                         | VALUE  | UNIT  |
|--------------------|-------------------------|--|-------|
| V <sub>(ESD)</sub> | Electrostatic discharge | Human-body model (HBM), per ANSI/ESDA/JEDEC JS-001 <sup>(1)</sup>              | ±1000 |
|                    |                         | Charged-device model (CDM), per JEDEC specification JESD22-C101 <sup>(2)</sup> | ±250  |
|                    |                         |  | V     |

- (1) JEDEC document JEP155 states that 500-V HBM allows safe manufacturing with a standard ESD control process.
- (2) JEDEC document JEP157 states that 250-V CDM allows safe manufacturing with a standard ESD control process.

### 5.3 Power on Hours (POH) Limits

The information in the section below is provided solely for your convenience and does not extend or modify the warranty provided under TI's standard terms and conditions for TI semiconductor products.

#### NOTE

POH is a function of voltage, temperature and time. Usage at higher voltages and temperatures will result in a reduction in POH.

- (1) Unless specified in [Table 5-3](#), all voltage domains and operating conditions are supported in the device at the noted temperatures.
- (2) Power on hours (POH) assume HDMI is used at the maximum supported bit rate continuously and/or operating the device continuously at the VD\_MPU operating point (OPP) noted.
- (3) 90k POH only if SuperSpeed USB 3.0 Dual-Role-Device (at 5 Gbps) or PCIe in Gen-II mode (at 5 Gbps) are used.

## 5.4 Recommended Operating Conditions

The device is used under the recommended operating conditions described in [Table 5-4](#).

### NOTE

Logic functions and parameter values are not assured out of the range specified in the recommended operating conditions.

(1) Refer to [Section 5.3](#), Power on Hour (POH) Limits for limitations.

(2) The voltage at the device ball should never be below the MIN voltage or above the MAX voltage for any amount of time. This requirement includes dynamic voltage events such as AC ripple, voltage transients, voltage dips, etc.

(3) The DC voltage at the device ball should never be above the MAX DC voltage to avoid impact on device reliability and lifetime POH (Power on Hour). The MAX DC voltage is defined as the highest allowed DC regulated voltage, without transients, seen at the ball.

## 5.5 Operating Performance Points

This section describes the operating conditions of the AM572x device. This section also contains the description of each OPP (operating performance point) for processor clocks and device core clocks.

[Table 5-5](#) describes the maximum supported frequency per speed grade for AM572x devices.

- (1) In a typical implementation, the power supply should target the NOM voltage.
- (2) The voltage at the device ball should never be below the MIN voltage or above the MAX voltage for any amount of time. This requirement includes dynamic voltage events such as AC ripple, voltage transients, voltage dips, etc.
- (3) The DC voltage at the device ball should never be above the MAX DC voltage to avoid impact on device reliability and lifetime POH (Power on Hour). The MAX DC voltage is defined as the highest allowed DC regulated voltage, without transients, seen at the ball.
- (4) For all OPPs, AVS must be enabled to avoid impact on device reliability, lifetime POH (Power on Hour), and device power.
- (5) The AVS voltages are device-dependent, voltage domain-dependent, and OPP-dependent. They must be read from the STD\_FUSE\_OPP. For information about STD\_FUSE\_OPP Registers address, please refer to Control Module Section of the TRM. The power supply should be adjustable over the following ranges for each required OPP:
  - OPP\_NOM for MPU: 0.85 V – 1.15 V
  - OPP\_NOM for CORE and Others: 0.85 V - 1.15 V
  - OPP\_OD: 0.885 V - 1.15 V
  - OPP\_HIGH: 0.95 V - 1.25 V
 The AVS voltages will be within the above specified ranges.
- (6) VD\_RTC can optionally be tied to VD\_CORE and operate at the VD\_CORE AVS voltages.
- (7) The power supply must be programmed with the AVS voltages for the MPU and the CORE voltage domain, either just after the ROM boot or at the earliest possible time in the secondary boot loader before there is significant activity seen on these domains.

(1) N/A in this table stands for Not Applicable.

(2) Maximum supported frequency is limited according to [Table 5-5, Speed Grade Maximum Frequency](#)).

### 5.5.3 Maximum Supported Frequency

Device modules either receive their clock directly from an external clock input, directly from a PLL, or from a PRCM. [Table 5-9](#) lists the clock source options for each module on this device, along with the maximum frequency that module can accept. To ensure proper module functionality, the device PLLs and dividers must be programmed not to exceed the maximum frequencies listed in this table.

## 5.6 Power Consumption Summary

### NOTE

Maximum power consumption for this SoC depends on the specific use conditions for the end system. Contact your TI representative for assistance in estimating maximum power consumption for the end system use case.

## 5.7 Electrical Characteristics

### NOTE

The data specified in [Section 5.7.1](#) through [Section 5.7.12](#) are subject to change.

### NOTE

The interfaces or signals described in [Section 5.7.1](#) through [Section 5.7.12](#) correspond to the interfaces or signals available in multiplexing mode 0 (Function 1).

All interfaces or signals multiplexed on the balls described in these tables have the same DC electrical characteristics, unless multiplexing involves a PHY/GPIO combination in which case different DC electrical characteristics are specified for the different multiplexing modes (Functions).

### 5.7.1 LVCMOS DDR DC Electrical Characteristics

[Table 5-10](#) summarizes the DC electrical characteristics for LVCMOS DDR Buffers.

### NOTE

For more information on the I/O cell configurations ( $i[2:0]$ ,  $sr[1:0]$ ), see the Chapter *Control Module* of the Device TRM.

- (1) VDDS stands for corresponding power supply (that is vdds\_dds1 or vdds\_dds2). For more information on the power supply name and the corresponding ball, see [Table 4-2](#), POWER [11] column.
- (2) VREF in this table stands for corresponding Reference Power Supply (that is ddr1\_vref0 or ddr2\_vref0). For more information on the power supply name and the corresponding ball, see [Table 4-2](#), POWER [11] column.

### 5.7.2 HDMIPHY DC Electrical Characteristics

The HDMIPHY DC Electrical Characteristics are compliant with the HDMI 1.4a specification and are not reproduced here.

### 5.7.3 Dual Voltage LVCMOS I<sup>2</sup>C DC Electrical Characteristics

[Table 5-11](#) summarizes the DC electrical characteristics for Dual Voltage LVCMOS I<sup>2</sup>C Buffers.

#### NOTE

For more information on the I/O cell configurations, see the Control Module section of the Device TRM.

- (1) The IHHV1833 buffer exists in the dual-voltage IO logic that can be powered by either 1.8V or 3.3V provided by vddshv3. However, the vddshv3 supply is only used for input protection circuitry, not for logic functionality. The logic in this buffer operates entirely on the vdds18v supply. Therefore, IHHV control is asserted whenever the input is low and vdds18v is valid.

### 5.7.11 SATAPHY DC Electrical Characteristics

#### NOTE

The SATA module is compliant with the electrical parameters specified in the *SATA-IO SATA Specification*, Revision 3.2, August 7, 2013.

### 5.7.12 PCIEPHY DC Electrical Characteristics

#### NOTE

The PCIe interfaces are compliant with the electrical parameters specified in PCI Express Base Specification Revision 3.0.

## 5.8 Thermal Characteristics

For reliability and operability concerns, the maximum junction temperature of the Device has to be at or below the  $T_J$  value identified in [Table 5-4](#), *Recommended Operating Conditions*.

It is recommended to perform thermal simulations at the system level with the worst case device power consumption.

### 5.8.1 Package Thermal Characteristics

[Table 5-18](#) provides the thermal resistance characteristics for the package used on this device.

#### NOTE

Power dissipation of 1.5 W and an ambient temperature of 85°C is assumed for ABC package.

## 5.9 Power Supply Sequences

This section describes the power-up and power-down sequence required to ensure proper device operation. The power supply names described in this section comprise a superset of a family of compatible devices. Some members of this family will not include a subset of these power supplies and their associated device modules. Refer to the [Section 4.2, Ball Characteristics](#) of the [Section 4, Terminal Configuration and Functions](#) to determine which power supplies are applicable.

### NOTE

RTC only mode is not supported feature.

---

Figure 5-2 and Figure 5-3 describe the device Power Sequencing when RTC-mode is NOT used.

Figure 5-2. Power-Up Sequencing

- (1) Grey shaded areas are windows where it is valid to ramp the voltage rail.
- (2) Blue dashed lines are not valid windows but show alternate ramp possibilities based on the associated note.
- (3) If RTC-only mode is not used then the following combinations are approved:
  - vdda\_rtc can be combined with vdds18v
  - vdd\_rtc can be combined with vdd

- vddshv5 can be combined with other 1.8V or 3.3V vddshvn rails.

If combinations listed above are not followed then sequencing for these 3 voltage rails should follow the RTC mode timing requirements.

When using RTC mode timing:

- vdda\_rtc rises coincident with, or before, the 1.8V interface supplies (such as vdds18v).

- vdd\_rtc rises coincident with vdd, or it may rise earlier. If rising earlier, it must rise after the 1.8V interface supplies.

- vddshv5 rises coincident with the other vddshvn rails (of the same voltage) or it can rise about the same time as the 1.8V PHY supplies (such as vdd\_usb1).

(4) vdd must ramp before or at the same time as vdd\_mpu, vdd\_gpu, vdd\_dspeve and vdd\_iva.

(5) vdd\_mpu, vdd\_gpu, vdd\_dspeve, vdd\_iva can be ramped at the same time or can be staggered.

(6) If any of the vddshv[1-7,9-11] rails (not including vddshv8) are used as 1.8V only, then these rails can be combined with vdds18v.

(7) vddshv8 is separated out to show support for dual voltage. If single voltage is used then vddshv8 can be combined with other vddshvn rails but vddshv8 must ramp after vdd.

(8) vdds and vdda rails must not be combined together, with the one exception of vdda\_rtc when RTC-mode is not supported.

(9) Pulse duration: rtc\_porz must remain low 1ms after vdda\_rtc, vddshv5, and vdd\_rtc are ramped and stable.

(10) The FUNC\_32K\_CLK source must be stable and at a valid frequency 1ms prior to deasserting rtc\_porz high.

(11) porz must remain asserted low until all of the following conditions are met:

- All device supply rails reach stable operational levels.

- xi\_osc0 is stable and at a valid frequency.

- Minimum of 12P after both of the above conditions are met, where  $P = 1 / (\text{SYS\_CLK1}/610)$ , units in ns. resetn must be high prior to, or rise simultaneous with, porz but not before its power supply, vddshv3, rising.

(12) Setup time: sysboot[15:0] pins must be valid  $2P^{(15)}$  before porz is de-asserted high.

(13) Hold time: sysboot[15:0] pins must be valid  $15P^{(15)}$  after porz is de-asserted high.

(14) rstoutn will be asserted low when porz is low, and de-asserted following an internal 2ms delay. rstoutn is only valid after vddshv3 reaches an operational level. If used as a peripheral component reset, it should be AND gated with porz to avoid possible reset glitches during power up.

(15)  $P = 1/(\text{SYS\_CLK1}/610)$  frequency in ns.

(16) ddr1\_vref0 / ddr2\_vref0 may rise coincident with vdds\_ddr1 / vdds\_ddr2, respectively or at a later time. However, it must be valid before porz rising.

SPRS953v\_ELCH\_05

Figure 5-3. Power-Down Sequencing<sup>(10)(11)</sup>

- (1) Grey shaded areas are windows where it is valid to ramp the voltage rail.
- (2) Blue dashed lines are not valid windows but show alternate ramp possibilities based on the associated note.
- (3) xi\_osc0 can be turned off anytime after porz assertion and must be turned off before vdda\_osc voltage rail is shutdown.
- (4) If RTC-mode is not used then the following combinations are approved:
  - vdda\_rtc can be combined with vdds18v
  - vdd\_rtc can be combined with vdd
  - vddshv5 can be combined with other 1.8V or 3.3V vddshv\* rails
 If combinations listed above are not followed then sequencing for these 3 voltage rails should follow the RTC mode timing requirements. When using RTC mode timing:
  - vdda\_rtc falls coincident with, or later than, the 1.8V interface supplies (such as vdds18v).
  - vdd\_rtc falls coincident with vdd, or it may fall later. If falling later, it must fall before, or coincident with, the 1.8V interface supplies.
  - vddshv5 falls coincident with the other vddshvn rails (of the same voltage) or it can fall about the same time as the 1.8V PHY supplies (such as vdd\_usb1).
- (5) vdd\_mpu, vdd\_gpu, vdd\_dspeve, vdd\_iva can be ramped at the same time or can be staggered.
- (6) vdd must ramp after or at the same time as vdd\_mpu, vdd\_gpu, vdd\_dspeve and vdd\_iva.

- (7) If any of the vddshv[1-7,9-11] rails (not including vddshv8) are used as 1.8V only, then these rails can be combined with vdds18v. vddshv[1-7,9-11] is allowed to ramp down at either of the two points shown in the timing diagram in either 1.8V mode or in 3.3V mode. If vddshv[1-7,9-11] ramps down at the later time in the diagram then the board design must ensure that the vddshv[1-7,9-11] rail is never higher than 2.0 V above the vdds18v rail.
- (8) vddshv8 is separated out to show support for dual voltage. If a dedicated LDO/supply source is used for vddshv8, then vddshv8 ramp down should occur at one of the two earliest points in the timing diagram. If vddshv8 is powered by the same supply source as the other vddshv[1-7,9-11] rails, then it is allowed to ramp down at either of the last two points in the timing diagram.
- (9) The 1.8V vdda\_\* supplies can either ramp down at the earlier time period shown or can be delayed to ramp down after the core supplies coincident with the vdds18v supply as long as porz is asserted (low) during the power down sequence.
- (10) The power down sequence shown is the most general case and is always valid. An accelerated power down sequence is also available but is only valid when porz is asserted (low). This accelerated power down sequence has been implemented in the companion PMIC that is recommended for use with this SOC. The accelerated sequence has porz go low first, then all 3.3V supplies simultaneously second, core supplies, DDR supplies and DDR references simultaneously third and all 1.8V supplies simultaneously last.
- (11) Ramped Down is defined as reaching a voltage level of no more than 0.6V.
- (12) ddr1\_vref0 / ddr2\_vref0 may fall coincident with vdds\_dds1 / vdds\_dds2, respectively or at a prior time but after porz is asserted low.

Figure 5-4 describes vddshv[1-7,9-11] Supplies Falling Before vdds18v Supplies Delta.

**Figure 5-4. vddshv\* Supplies Falling After vdds18v Supplies Delta**

- (1) Vdelta MAX = 2V
- (2) If vddshv8 is powered by the same supply source as the other vddshv[1-7,9-11] rails.

## 6 Clock Specifications

---

### NOTE

For more information, see Power, Reset, and Clock Management / PRCM Subsystem Environment / External Clock Signals and External Reset Signals, and Clock Management Functional Description sections of the Device TRM.

---

### NOTE

Audio Back End (ABE) module is not supported for this family of devices, but “ABE” name is still present in some clock or DPLL names.

---

The device operation requires the following clocks:

- The 32 kHz frequency is used for low frequency operation. It supplies the wake-up domain for operation in lowest power mode. This is an optional clock and will be supplied by on chip divider + mux (FUNC\_32K\_CLK) incase it is not available on external pin.
- The system clocks, SYS\_CLK1(Mandatory) and SYS\_CLK2(Optional) are the main clock sources of the device. They supply the reference clock to the DPLLs as well as functional clock to several modules.

The Device also embeds an internal free-running 32-kHz oscillator that is always active as long as the the wake-up (WKUP) domain is supplied.

Figure 6-1 shows the external input clock sources and the output clocks to peripherals.

Figure 6-1. Clock Interface

## 6.1 Input Clock Specifications

### 6.1.1 Input Clock Requirements

- The source of the internal system clock (SYS\_CLK1) could be either:
  - A CMOS clock that enters on the xi\_osc0 ball (with xo\_osc0 left unconnected on the CMOS clock case).
  - A crystal oscillator clock managed by xi\_osc0 and xo\_osc0.
- The source of the internal system clock (SYS\_CLK2) could be either:
  - A CMOS clock that enters on the xi\_osc1 ball (with xo\_osc1 left unconnected on the CMOS clock case).
  - A crystal oscillator clock managed by xi\_osc1 and xo\_osc1.

- The source of the internal system clock (FUNC\_32K\_CLK) could be either:
  - A CMOS clock that enters on the rtc\_osc\_xi\_clkin32 ball and supports external LVCMOS clock generators
  - A crystal oscillator clock managed by rtc\_osc\_xi\_clkin32 and rtc\_osc\_xo.

### 6.1.2 System Oscillator OSC0 Input Clock

SYS\_CLK1 is received directly from oscillator OSC0. For more information about SYS\_CLK1 see Device TRM, Chapter: *Power, Reset, and Clock Management*.

#### 6.1.2.1 OSC0 External Crystal

An external crystal is connected to the device pins. [Figure 6-2](#) describes the crystal implementation.

**Figure 6-2. Crystal Implementation**

#### NOTE

The load capacitors,  $C_{f1}$  and  $C_{f2}$  in [Figure 6-2](#), should be chosen such that the below equation is satisfied.  $C_L$  in the equation is the load specified by the crystal manufacturer. All discrete components used to implement the oscillator circuit should be placed as close as possible to the associated oscillator xi\_osc0, xo\_osc0, and vssa\_osc0 pins.

$$C_L = \frac{C_{f1} C_{f2}}{(C_{f1} + C_{f2})}$$

**Figure 6-3. Load Capacitance Equation**

The crystal must be in the fundamental mode of operation and parallel resonant. [Table 6-1](#) summarizes the required electrical constraints.

### 6.1.2.2 OSC0 Input Clock

A 1.8-V LVCMOS-Compatible Clock Input can be used instead of the internal oscillator to provide the SYS\_CLK1 clock input to the system. The external connections to support this are shown in Figure 6-4. The xi\_osc0 pin is connected to the 1.8-V LVCMOS-Compatible clock source. The xi\_osc0 pin is left unconnected. The vssa\_osc0 pin is connected to board ground (VSS).

(1) Period jitter is meant here as follows:

- The maximum value is the difference between the longest measured clock period and the expected clock period
- The minimum value is the difference between the shortest measured clock period and the expected clock period

(2) Crystal characteristics should account for tolerance+stability+aging.

**6.1.3.2 OSC1 Input Clock**

A 1.8-V LVCMOS-Compatible Clock Input can be used instead of the internal oscillator to provide the SYS\_CLK2 clock input to the system. The external connections to support this are shown in, Figure 6-8. The xi\_osc1 pin is connected to the 1.8-V LVCMOS-Compatible clock sources. The xo\_osc1 pin is left unconnected. The vssa\_osc1 pin is connected to board ground (vss).

- (1) To switch from bypass mode to crystal or from crystal mode to bypass mode, there is a waiting time about 100 μs; however, if the chip comes from bypass mode to crystal mode the crystal will start-up after time mentioned in Table 6-6,  $t_{SX}$  parameter.
- (2) Before the processor boots up and the oscillator is set to bypass mode, there is a waiting time when the internal oscillator is in application mode and receives a wave. The switching time in this case is about 100 μs.

Table 6-8 details the OSC1 input clock timing requirements.

- (1) Period jitter is meant here as follows:
  - The maximum value is the difference between the longest measured clock period and the expected clock period
  - The minimum value is the difference between the shortest measured clock period and the expected clock period
- (2) Crystal characteristics should account for tolerance+stability+aging.
- (3) The Period jitter requirement for osc1 can be relaxed to  $0.02 \times t_{c(xiosc1)}$  under the following constraints:
  - a. The osc1/SYS\_CLK2 clock bypasses all device PLLs
  - b. The osc1/SYS\_CLK2 clock is only used to source the DSS pixel clock outputs

### 6.1.4 RTC Oscillator Input Clock

FUNC\_32K\_CLK is received directly from RTC Oscillator. For more information about FUNC\_32K\_CLK see Device TRM, Chapter: *Power, Reset, and Clock Management*.

**NOTE**

RTC only mode is not supported feature.

#### 6.1.4.1 RTC Oscillator External Crystal

An external crystal is connected to the device pins. Figure 6-10 describes the crystal implementation.

Figure 6-10. Crystal Implementation

**NOTE**

The load capacitors,  $C_{f1}$  and  $C_{f2}$  in Figure 6-10, should be chosen such that the below equation is satisfied.  $C_L$  in the equation is the load specified by the crystal manufacturer. All discrete components used to implement the oscillator circuit should be placed as close as possible to the associated oscillator `rtc_osc_xi_clkin32` and `rtc_osc_xo` pins.

$$C_L = \frac{C_{f1} C_{f2}}{(C_{f1} + C_{f2})}$$

Figure 6-11. Load Capacitance Equation

The crystal must be in the fundamental mode of operation and parallel resonant. Table 6-9 summarizes the required electrical constraints.

When selecting a crystal, the system design must take into account the temperature and aging characteristics of a crystal versus the user environment and expected lifetime of the system.

Table 6-10 details the switching characteristics of the oscillator and the requirements of the input clock.

### 6.1.4.2 RTC Oscillator Input Clock

A 1.8-V LVCMOS-Compatible Clock Input can be used instead of the internal oscillator to provide the FUNC\_32K\_CLK clock input to the system. The external connections to support this are shown in Figure 6-12. The rtc\_osc\_xi\_clkin32 pin is connected to the 1.8-V LVCMOS-Compatible clock sources. The rtc\_osc\_xo pin is left unconnected.

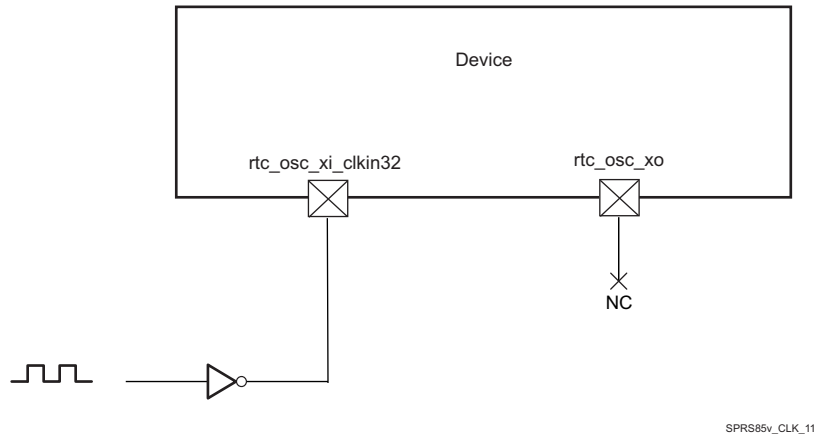

Figure 6-12. LVC MOS-Compatible Clock Input

Table 6-11 summarizes the RTC Oscillator input clock electrical characteristics.

(1) Before the processor boots up and the oscillator is set to bypass mode, there is a waiting time when the internal oscillator is in application mode and receives a wave. The switching time in this case is about 100 μs.

## 6.2 RC On-die Oscillator Clock

### NOTE

The OSC\_32K\_CLK clock, provided by the On-die 32K RC oscillator, inside of the SoC, is not accurate 32kHz clock.

The frequency may significantly vary with temperature and silicon characteristics.

For more information about OSC\_32K\_CLK see the Device TRM, Chapter: *Power, Reset, and Clock Management*.

## 6.3 DPLLs, DLLs Specifications

---

**NOTE**

For more information, see:

- Power, Reset, and Clock Management / Clock Management Functional / Internal Clock Sources and Generators / Generic DPLL Overview section  
and
  - Display Subsystem / Display Subsystem Overview section of the Device TRM.
- 

To generate high-frequency clocks, the device supports multiple on-chip DPLLs controlled directly by the PRCM module. They are of two types: type A and type B DPLLs.

- They have their own independent power domain (each one embeds its own switch and can be controlled as an independent functional power domain)
- They are fed with ALWAYS ON system clock, with independent control per DPLL.

The different DPLLs managed by the PRCM are listed below:

- DPLL\_MPU: It supplies the MPU subsystem clocking internally.
  - DPLL\_IVA: It feeds the IVA subsystem clocking.
  - DPLL\_CORE: It supplies all interface clocks and also few module functional clocks.
  - DPLL\_PER: It supplies several clock sources: a 192-MHz clock for the display functional clock, a 96-MHz functional clock to subsystems and peripherals.
  - DPLL\_ABE: It provides clocks to various modules within the device.
  - DPLL\_USB: It provides 960M clock for USB modules (USB1/2/3/4).
  - DPLL\_GMAC: It supplies several clocks for the Gigabit Ethernet Switch (GMAC\_SW).
  - DPLL\_DSP: It feeds the DSP Subsystem clocking.
  - DPLL\_GPU: It supplies clock for the GPU Subsystem.
  - DPLL\_DDR: It generates clocks for the two External Memory Interface (EMIF) controllers and their associated EMIF PHYs.
  - DPLL\_PCIE\_REF: It provides reference clock for the APLL\_PCIE in PCIE Subsystem.
  - APLL\_PCIE: It feeds clocks for the device Peripheral Component Interconnect Express (PCIe) controllers.
- 

**NOTE**

The following DPLLs are controlled by the clock manager located in the always-on Core power domain (CM\_CORE\_AON):

- DPLL\_MPU, DPLL\_IVA, DPLL\_CORE, DPLL\_ABE, DPLL\_DDR, DPLL\_GMAC, DPLL\_PCIE\_REF, DPLL\_PER, DPLL\_USB, DPLL\_DSP, DPLL\_GPU, APLL\_PCIE\_REF.
- 

For more information on CM\_CORE\_AON and CM\_CORE or PRCM DPLLs, see the Power, Reset, and Clock Management chapter of the Device TRM.

The following DPLLs are not managed by the PRCM:

- DPLL\_VIDEO1; (It is controlled from DSS)
- DPLL\_VIDEO2; (It is controlled from DSS)
- DPLL\_HDMI; (It is controlled from DSS)
- DPLL\_SATA; (It is controlled from SATA)
- DPLL\_DEBUG; (It is controlled from DEBUGSS)
- DPLL\_USB\_OTG\_SS; (It is controlled from OCP2SCP1)

### NOTE

For more information for not controlled from PRCM DPLL's see the related chapters in TRM.

### 6.3.1 DPLL Characteristics

The DPLL has three relevant input clocks. One of them is the reference clock (CLKINP) used to generate the synthesized clock but can also be used as the bypass clock whenever the DPLL enters a bypass mode. It is therefore mandatory. The second one is a fast bypass clock (CLKINPULOW) used when selected as the bypass clock and is optional. The third clock (CLKINPHIF) is explained in the next paragraph.

The DPLL has three output clocks (namely CLKOUT, CLKOUTX2, and CLKOUTHIF). CLKOUT and CLKOUTX2 run at the bypass frequency whenever the DPLL enters a bypass mode. Both of them are generated from the lock frequency divided by a post-divider (namely M2 post-divider). The third clock, CLKOUTHIF, has no automatic bypass capability. It is an output of a post-divider (M3 post-divider) with the input clock selectable between the internal lock clock (Fdpll) and CLKINPHIF input of the PLL through an asynchronous multiplexing.

For more information, see the Power, Reset, and Clock Management chapter of the Device TRM.

Table 6-12 summarizes DPLL type described in Section 6.3, *DPLLs, DLLs Specifications* introduction.

(1) The minimum frequencies on CLKOUT and CLKOUTX2 are assuming M2 = 1.

For M2 > 1, the minimum frequency on these clocks will further scale down by factor of M2.

(2) The maximum frequencies on CLKOUT and CLKOUTX2 are assuming M2 = 1.

(3) The minimum frequency on CLKOUTHIF is assuming M3 = 1. For M3 > 1, the minimum frequency on this clock will further scale down by factor of M3.

(4) The maximum frequency on CLKOUTHIF is assuming M3 = 1.

(5) Relock time assumes typical operating conditions, 10°C maximum temperature drift.

(6) Bypass mode: f<sub>CLKOUT</sub> = F<sub>INP</sub> if ULOWCLKEN = 0. For more information, see the Device TRM.

(1) The minimum frequency on CLKOUT is assuming M2 = 1.

For M2 > 1, the minimum frequency on this clock will further scale down by factor of M2.

(2) The maximum frequency on CLKOUT is assuming M2 = 1.

(3) Relock time assumes typical operating conditions, 10°C maximum temperature drift.

(4) Bypass mode:  $f_{CLKOUT} = F_{INP}$  if ULOWCLKEN = 0. For more information, see the Device TRM.

(5) For output clocks, there are two frequency ranges according to the SELFREQDCO setting. For more information, see the Device TRM.

### 6.3.2 DLL Characteristics

Table 6-15 summarizes the DLL characteristics and assumes testing over recommended operating conditions.

**Table 6-15. DLL Characteristics**

| NAME         | DESCRIPTION  | MIN | TYP | MAX | UNIT   |
|--------------|--|-----|-----|-----|--------|
| $f_{input}$  | Input clock frequency (EMIF_DLL_FCLK)                                    |     |     | 266 | MHz    |
| $t_{lock}$   | Lock time  |     |     | 50k | cycles |
| $t_{relock}$ | Relock time (a change of the DLL frequency implies that DLL must relock) |     |     | 50k | cycles |

## 7 Timing Requirements and Switching Characteristics

### 7.1 Timing Test Conditions

All timing requirements and switching characteristics are valid over the recommended operating conditions unless otherwise specified.

### 7.2 Interface Clock Specifications

#### 7.2.1 Interface Clock Terminology

The interface clock is used at the system level to sequence the data and/or to control transfers accordingly with the interface protocol.

#### 7.2.2 Interface Clock Frequency

The two interface clock characteristics are:

- The maximum clock frequency
- The maximum operating frequency

The interface clock frequency documented in this document is the maximum clock frequency, which corresponds to the maximum frequency programmable on this output clock. This frequency defines the maximum limit supported by the Device IC and does not take into account any system consideration (PCB, peripherals).

The system designer will have to consider these system considerations and the Device IC timing characteristics as well to define properly the maximum operating frequency that corresponds to the maximum frequency supported to transfer the data on this interface.

### 7.3 Timing Parameters and Information

The timing parameter symbols used in the timing requirement and switching characteristic tables are created in accordance with JEDEC Standard 100. To shorten the symbols, some of pin names and other related terminologies have been abbreviated as follows:

**Table 7-1. Timing Parameters**

7.3.1 Parameter Information

Figure 7-1. Test Load Circuit for AC Timing Measurements

The load capacitance value stated is only for characterization and measurement of AC timing signals. This load capacitance value does not indicate the maximum load the device is capable of driving.

7.3.1.1 1.8V and 3.3V Signal Transition Levels

All input and output timing parameters are referenced to  $V_{ref}$  for both "0" and "1" logic levels.  $V_{ref} = (V_{DD} I/O)/2$ .

Figure 7-2. Input and Output Voltage Reference Levels for AC Timing Measurements

All rise and fall transition timing parameters are referenced to  $V_{IL} MAX$  and  $V_{IH} MIN$  for input clocks,  $V_{OL} MAX$  and  $V_{OH} MIN$  for output clocks.

Figure 7-3. Rise and Fall Transition Time Voltage Reference Levels

7.3.1.2 1.8V and 3.3V Signal Transition Rates

The default SLEWCONTROL settings in each pad configuration register must be used to ensure timings, unless specific instructions otherwise are given in the individual timing sub-sections of the datasheet.

All timings are tested with an input edge rate of 4 volts per nanosecond (4 V/ns).

### 7.3.1.3 Timing Parameters and Board Routing Analysis

The timing parameter values specified in this data manual do not include delays by board routes. As a good board design practice, such delays must always be taken into account. Timing values may be adjusted by increasing/decreasing such delays. TI recommends using the available I/O buffer information specification (IBIS) models to analyze the timing characteristics correctly. To properly use IBIS models to attain accurate timing analysis for a given system, see the *Using IBIS Models for timing Analysis* application report (literature number [SPRA839](#)). If needed, external logic hardware such as buffers may be used to compensate any timing differences.

## 7.4 Recommended Clock and Control Signal Transition Behavior

All clocks and control signals must transition between  $V_{IH}$  and  $V_{IL}$  (or between  $V_{IL}$  and  $V_{IH}$ ) in a monotonic manner. Monotonic transitions are more easily ensured with faster switching signals. Slower input transitions are more susceptible to glitches due to noise and special care should be taken for slow input clocks.

## 7.5 Virtual and Manual I/O Timing Modes

Some of the timings described in the following sections require the use of Virtual or Manual I/O Timing Modes. [Table 7-2](#) provides a summary of the Virtual and Manual I/O Timing Modes across all device interfaces. The individual interface timing sections found later in this document provide the full description of each applicable Virtual and Manual I/O Timing Mode. Refer to the Pad Configuration section of the device TRM for the procedure on implementing the Virtual and Manual Timing Modes in a system.

## 7.6 Video Input Ports (VIP)

The Device includes 3 Video Input Ports (VIP).

Table 7-3, Figure 7-4 and Figure 7-5 present timings and switching characteristics of the VIPs.

### CAUTION

The IO timings provided in this section are applicable for all combinations of signals for vin1, vin5 and vin6. However, the timings are only valid for vin2, vin3, and vin4 if signals within a single IOSET are used. The IOSETs are defined in the Table 7-4.

| V5  | $t_h(\text{CLK-CTL/DATA})$    | Input hold time, Control ( $\text{vin}_x\text{\_dei}$ , $\text{vin}_x\text{\_vsync}_i$ , $\text{vin}_x\text{\_fld}_i$ , $\text{vin}_x\text{\_hsync}_i$ ) and Data ( $\text{vin}_x\text{\_dn}$ ) valid from $\text{vin}_x\text{\_clk}_i$ transition (3) (4) (5) |                 | -0.05              |     | ns   |

(1) For maximum frequency of 165 MHz.

(2)  $P = \text{vin}_x\text{\_clk}_i$  period.

(3)  $x$  in  $\text{vin}_x = 1a, 1b, 2a, 2b, 3a, 3b, 4a, 4b, 5a$  and  $6a$ .

(4)  $n$  in  $\text{dn} = 0$  to  $7$  when  $x = 1b, 2b, 3b$  and  $4b$ ;  
 $n = 0$  to  $15$  when  $x = 5a$  and  $6a$ ;  
 $n = 0$  to  $23$  when  $x = 1a, 2a, 3a$  and  $4a$ ;

(5)  $i$  in  $\text{clk}_i, \text{dei}, \text{vsync}_i, \text{hsync}_i$  and  $\text{fld}_i = 0$  or  $1$ .

**NOTE**

To configure the desired Manual IO Timing Mode the user must follow the steps described in section Manual IO Timing Modes of the Device TRM.

The associated registers to configure are listed in the **CFG REGISTER** column. For more information see the Control Module chapter in the Device TRM.

---

Manual IO Timings Modes must be used to ensure some IO timings for VIP1. See [Table 7-2 Modes Summary](#) for a list of IO timings requiring the use of Manual IO Timings Modes. See [Table 7-7 Manual Functions Mapping for VIP1](#) for a definition of the Manual modes.

[Table 7-7](#) lists the A\_DELAY and G\_DELAY values needed to calculate the correct values to be set in the CFG\_x registers.

Manual IO Timings Modes must be used to ensure some IO timings for VIP1. See [Table 7-2 Modes Summary](#) for a list of IO timings requiring the use of Manual IO Timings Modes. See [Table 7-8 Manual Functions Mapping for VIP1 2B](#) for a definition of the Manual modes.

[Table 7-8](#) lists the A\_DELAY and G\_DELAY values needed to calculate the correct values to be set in the CFG\_x registers.

(1) The CFG\_MMC3\_CLK\_IN register should remain at its Default value, which is programmed automatically by hardware during the recalibration process.

Manual IO Timings Modes must be used to ensure some IO timings for VIP2. See [Table 7-2 Modes Summary](#) for a list of IO timings requiring the use of Manual IO Timings Modes. See [Table 7-9 Manual Functions Mapping for VIP2](#) for a definition of the Manual modes.

[Table 7-9](#) lists the A\_DELAY and G\_DELAY values needed to calculate the correct values to be set in the CFG\_x registers.

Manual IO Timings Modes must be used to ensure some IO timings for VIP2. See [Table 7-2 Modes Summary](#) for a list of IO timings requiring the use of Manual IO Timings Modes. See [Table 7-10 Manual Functions Mapping for VIP2 4A](#) for a definition of the Manual modes.

[Table 7-10](#) lists the A\_DELAY and G\_DELAY values needed to calculate the correct values to be set in the CFG\_x registers.

Manual IO Timings Modes must be used to ensure some IO timings for VIP2. See [Table 7-2 Modes Summary](#) for a list of IO timings requiring the use of Manual IO Timings Modes. See [Table 7-11 Manual Functions Mapping for VIP2 4A IOSET3](#) for a definition of the Manual modes.

[Table 7-11](#) lists the A\_DELAY and G\_DELAY values needed to calculate the correct values to be set in the CFG\_x registers.

## 7.7 Display Subsystem – Video Output Ports

Three Display Parallel Interfaces (DPI) channels are available in DSS named DPI Video Output 1, DPI Video Output 2 and DPI Video Output 3.

### NOTE

The DPI Video Output *i* (*i* = 1 to 3) interface is also referred to as VOUT<sub>*i*</sub>.

Every VOUT interface consists of:

- 24-bit data bus (data[23:0])
- Horizontal synchronization signal (HSYNC)
- Vertical synchronization signal (VSYNC)
- Data enable (DE)
- Field ID (FID)
- Pixel clock (CLK)

### NOTE

For more information, see the Display Subsystem chapter of the Device TRM.

### CAUTION

The IO timings provided in this section are only valid if signals within a single IOSET are used. The IOSETs are defined in the [Table 7-19](#) and [Table 7-20](#).

### CAUTION

The IO Timings provided in this section are only valid for some DSS usage modes when the corresponding Virtual IO Timings or Manual IO Timings are configured as described in the tables found in this section.

### CAUTION

All pads/balls configured as vout<sub>*n*</sub>\_\* signals are recommended to use slow slew rate by setting the corresponding CTRL\_CORE\_PAD\_\*[SLEWCONTROL] register field to SLOW (0b1). FAST slew setting is allowed, but results in faster edge rates on the VOUT<sub>*n*</sub> bus, higher power/ground noise, and higher EMI emissions compared to SLOW slew rate.

[Table 7-15](#), [Table 7-16](#) and [Figure 7-6](#) assume testing over the recommended operating conditions and electrical characteristic conditions

(1) P = output vouti\_clk period in ns.

(2) All pads/balls configured as vouti\_\* signals are recommended to use slow slew rate by setting the corresponding CTRL\_CORE\_PAD\_\*[SLEWCONTROL] register field to SLOW (0b1). FAST slew setting is allowed, but results in faster edge rates on the VOUTn bus, higher power/ground noise, and higher EMI emissions compared to SLOW slew rate.

(3) SERDES transceivers may be sensitive to the jitter profile of vouti\_clk. A clock jitter cleaner such as the CDCE813 may be needed to meet the required jitter masks of the SERDES transceiver. See Application Note [SPRAC62](#) for general reference on a similar device with the same interface.

- (1) P = output vouti\_clk period in ns.
- (2) SERDES transceivers may be sensitive to the jitter profile of vouti\_clk. A clock jitter cleaner such as the CDCE813 may be needed to meet the required jitter masks of the SERDES transceiver. See Application Note [SPRAC62](#) for general reference on a similar device with the same interface.

**Figure 7-6. DPI Video Output<sup>(1)(2)(3)</sup>**

- (1) The configuration of assertion of the data can be programmed on the falling or rising edge of the pixel clock.
- (2) The polarity and the pulse width of vouti\_hsync and vouti\_vsync are programmable, refer to the DSS section of the device TRM.
- (3) The vouti\_clk frequency can be configured, refer to the DSS section of the device TRM.

**NOTE**

To configure the desired virtual mode the user must set MODESELECT bit and DELAYMODE bitfield for each corresponding pad control register.

The pad control registers are presented in [Table 4-3](#) and described in Control Module chapter of the Device TRM.

In [Table 7-19](#) are presented the specific groupings of signals (IOSET) for use with VOUT2.

(1) The VOUT3 interface when multiplexed onto balls mapped to the VDDSHV6 supply rail is restricted to operating in 1.8V mode only (VDDSHV6 must be supplied with 1.8V). 3.3V mode is not supported. This must be considered in the pin mux programming and VDDSHVx supply connections.

**NOTE**

To configure the desired Manual IO Timing Mode the user must follow the steps described in section Manual IO Timing Modes of the Device TRM.

The associated registers to configure are listed in the **CFG REGISTER** column. For more information see the Control Module chapter in the Device TRM.

Manual IO Timings Modes must be used to ensure some IO timings for VOUT1. See [Table 7-2 Modes Summary](#) for a list of IO timings requiring the use of Manual IO Timings Modes. See [Table 7-21 Manual Functions Mapping for DSS VOUT1](#) for a definition of the Manual modes.

[Table 7-21](#) lists the A\_DELAY and G\_DELAY values needed to calculate the correct values to be set in the CFG\_x registers.

Manual IO Timings Modes must be used to ensure some IO timings for VOUT2. See [Table 7-2 Modes Summary](#) for a list of IO timings requiring the use of Manual IO Timings Modes. See [Table 7-22 Manual Functions Mapping for DSS VOUT2](#) for a definition of the Manual modes.

[Table 7-22](#) lists the A\_DELAY and G\_DELAY values needed to calculate the correct values to be set in the CFG\_x registers.

Manual IO Timings Modes must be used to ensure some IO timings for VOUT2. See [Table 7-2 Modes Summary](#) for a list of IO timings requiring the use of Manual IO Timings Modes. See [Table 7-23 Manual Functions Mapping for DSS VOUT2 IOSET2](#) for a definition of the Manual modes.

[Table 7-23](#) lists the A\_DELAY and G\_DELAY values needed to calculate the correct values to be set in the CFG\_x registers.

Manual IO Timings Modes must be used to ensure some IO timings for VOUT3. See [Table 7-2 Modes Summary](#) for a list of IO timings requiring the use of Manual IO Timings Modes. See [Table 7-24 Manual Functions Mapping for DSS VOUT3](#) for a definition of the Manual modes.

[Table 7-24](#) lists the A\_DELAY and G\_DELAY values needed to calculate the correct values to be set in the CFG\_x registers.

## 7.8 Display Subsystem – High-Definition Multimedia Interface (HDMI)

The High-Definition Multimedia Interface is provided for transmitting digital television audiovisual signals from DVD players, set-top boxes and other audiovisual sources to television sets, projectors and other video displays. The HDMI interface is aligned with the HDMI TMDS single stream standard v1.4a (720p @60Hz to 1080p @24Hz) and the HDMI v1.3 (1080p @60Hz): 3 data channels, plus 1 clock channel is supported (differential).

### NOTE

For more information, see the High-Definition Multimedia Interface section of the device TRM.

## 7.9 External Memory Interface (EMIF)

The device has a dedicated interface to DDR3 SDRAM. It supports JEDEC standard compliant DDR3 SDRAM devices with the following features:

- 16-bit or 32-bit data path to external SDRAM memory
- Memory device capacity: 128Mb, 256Mb, 512Mb, 1Gb, 2Gb, 4Gb and 8Gb devices (Single die only)
- One interface with associated DDR3 PHYs

### NOTE

For more information, see the EMIF Controller section of the Device TRM.

## 7.10 General-Purpose Memory Controller (GPMC)

The GPMC is the unified memory controller that interfaces external memory devices such as:

- Asynchronous SRAM-like memories and ASIC devices
- Asynchronous page mode and synchronous burst NOR flash
- NAND flash

### NOTE

For more information, see the General-Purpose Memory Controller section of the Device TRM.

### 7.10.1 GPMC/NOR Flash Interface Synchronous Timing

#### CAUTION

The IO Timings provided in this section are only valid for some GPMC usage modes when the corresponding Virtual IO Timings or Manual IO Timings are configured as described in the tables found in this section.

Table 7-25 and Table 7-26 assume testing over the recommended operating conditions and electrical characteristic conditions below (see Figure 7-7, Figure 7-8, Figure 7-9, Figure 7-10, Figure 7-11, and Figure 7-12).

FA21 calculation is detailed in a separated application note and should be stored inside AccessTime register bits field.
- (3) FA20 parameter illustrates amount of time required to internally sample successive input Page Data. It is expressed in number of GPMC functional clock cycles. After each access to input Page Data, next input Page Data will be internally sampled by active functional clock edge after FA20 functional clock cycles. FA20 is also the duration of address phases for successive input Page Data (excluding first input Page Data). FA20 value should be stored in PageBurstAccessTime register bits field.
- (4) GPMC\_FCLK is an internal clock (GPMC functional clock) not provided externally.
- (5) The "DIR" (direction control) output signal is NOT pinned out on any of the device pads. It is an internal signal only representing a signal direction on the GPMC data bus.

**Figure 7-16. GPMC / NOR Flash - Asynchronous Write - Single Word Timing<sup>(1)</sup>**

- (1) In *gpmc\_csi*, *i* = 0 to 7. In *gpmc\_waitj*, *j* = 0 to 1.
- (2) The "DIR" (direction control) output signal is NOT pinned out on any of the device pads. It is an internal signal only representing a signal direction on the GPMC data bus.

- (1) In  $gpmc\_csi$ ,  $i = 0$  to 7. In  $gpmc\_waitj$ ,  $j = 0$  to 1
- (2) FA5 parameter illustrates amount of time required to internally sample input Data. It is expressed in number of GPMC functional clock cycles. From start of read cycle and after FA5 functional clock cycles, input Data will be internally sampled by active functional clock edge. FA5 value should be stored inside AccessTime register bits field.

### 7.10.3 GPMC/NAND Flash Interface Asynchronous Timing

**CAUTION**

The IO Timings provided in this section are only valid for some GPMC usage modes when the corresponding Virtual IO Timings or Manual IO Timings are configured as described in the tables found in this section.

Table 7-31 and Table 7-32 assume testing over the recommended operating conditions and electrical characteristic conditions below (see Figure 7-19, Figure 7-20, Figure 7-21, and Figure 7-22).

**NOTE**

To configure the desired virtual mode the user must set MODESELECT bit and DELAYMODE bitfield for each corresponding pad control register.

The pad control registers are presented in [Table 4-3](#) and described in Device TRM, *Chapter 18 - Control Module*.

Virtual IO Timings Modes must be used to ensure some IO timings for GPMC. See [Table 7-2 Modes Summary](#) for a list of IO timings requiring the use of Virtual IO Timings Modes. See [Table 7-33 Virtual Functions Mapping for GPMC](#) for a definition of the Virtual modes.

[Table 7-33](#) presents the values for DELAYMODE bitfield.

## 7.11 Timers

The device has 16 general-purpose (GP) timers (TIMER1 - TIMER16), two watchdog timers, and a 32-kHz synchronized timer (COUNTER\_32K) that have the following features:

- Dedicated input trigger for capture mode and dedicated output trigger/pulse width modulation (PWM) signal
- Interrupts generated on overflow, compare, and capture
- Free-running 32-bit upward counter
- Supported modes:
  - Compare and capture modes
  - Auto-reload mode
  - Start-stop mode
- On-the-fly read/write register (while counting)

The device has two system watchdog timer (WD\_TIMER1 and WD\_TIMER2) that have the following features:

- Free-running 32-bit upward counter
- On-the-fly read/write register (while counting)
- Reset upon occurrence of a timer overflow condition

The device includes one instance of the 32-bit watchdog timer: WD\_TIMER2, also called the MPU watchdog timer.

The watchdog timer is used to provide a recovery mechanism for the device in the event of a fault condition, such as a non-exiting code loop.

**NOTE**

For additional information on the Timer Module, see Timers chapter in the Device TRM.

**7.12 Inter-Integrated Circuit Interface (I2C)**

The device includes 5 inter-integrated circuit (I2C) modules which provide an interface to other devices compliant with Philips Semiconductors Inter-IC bus (I2C-bus™) specification version 2.1. External components attached to this 2-wire serial bus can transmit/receive 8-bit data to/from the device through the I2C module.

**NOTE**

Note that, on I2C1 and I2C2, due to characteristics of the open drain IO cells, HS mode is not supported.

**NOTE**

Inter-integrated circuit i (i=1 to 5) module is also referred to as I2Ci.

**NOTE**

For more information, see the Multimaster High-Speed I2C Controller section of the Device TRM.

- (1) The I2C pins SDA and SCL do not feature fail-safe I/O buffers. These pins could potentially draw current when the device is powered down.
- (2) A Fast-mode I<sup>2</sup>C-bus™ device can be used in a Standard-mode I<sup>2</sup>C-bus system, but the requirement  $t_{su(SDA-SCLH)} \geq 250$  ns must then be met. This will automatically be the case if the device does not stretch the LOW period of the SCL signal. If such a device does stretch the LOW period of the SCL signal, it must output the next data bit to the SDA line  $t_r, \max + t_{su(SDA-SCLH)} = 1000 + 250 = 1250$  ns (according to the Standard-mode I<sup>2</sup>C-Bus Specification) before the SCL line is released.
- (3) A device must internally provide a hold time of at least 300 ns for the SDA signal (referred to the  $V_{IHmin}$  of the SCL signal) to bridge the undefined region of the falling edge of SCL.
- (4) The maximum  $t_{h(SDA-SCLL)}$  has only to be met if the device does not stretch the low period  $[t_{w(SCLL)}]$  of the SCL signal.
- (5)  $C_b$  = total capacitance of one bus line in pF. If mixed with HS-mode devices, faster fall-times are allowed.

- (1) I<sup>2</sup>C HS-Mode is only supported on I<sup>2</sup>C3/4/5. I2C HS-Mode is not supported on I<sup>2</sup>C1/2.
- (2) For bus line loads  $C_b$  between 100 and 400 pF the timing parameters must be linearly interpolated.
- (3) A device must internally provide a Data hold time to bridge the undefined part between  $V_{IH}$  and  $V_{IL}$  of the falling edge of the SCLH signal. An input circuit with a threshold as low as possible for the falling edge of the SCLH signal minimizes this hold time.

- (1)  $C_b$  = total capacitance of one bus line in pF. If mixed with HS-mode devices, faster fall-times are allowed.
- (2) Software must properly configure the I2C module registers to achieve the timings shown in this table. See the Device TRM for details.
- (3) These timings apply only to I2C1 and I2C2. I2C3, I2C4, and I2C5 use standard LVCMOS buffers to emulate open-drain buffers and their rise/fall times should be referenced in the device IBIS model.

**NOTE**

I2C emulation is achieved by configuring the LVCMOS buffers to output Hi-Z instead of driving high when transmitting logic-1.

### 7.13 HDQ / 1-Wire Interface (HDQ1W)

The module is intended to work with both HDQ and 1-Wire protocols. The protocols use a single wire to communicate between the master and the slave. The protocols employ an asynchronous return to one mechanism where, after any command, the line is pulled high.

**NOTE**

For more information, see the HDQ / 1-Wire section of the Device TRM.

#### 7.13.1 HDQ / 1-Wire — HDQ Mode

Table 7-37 and Table 7-38 assume testing over the recommended operating conditions and electrical characteristic conditions below (see Figure 7-25, Figure 7-26, Figure 7-27, and Figure 7-28).

### 7.14 Universal Asynchronous Receiver Transmitter (UART)

The UART performs serial-to-parallel conversions on data received from a peripheral device and parallel-to-serial conversion on data received from the CPU. There are 10 UART modules in the device. Only one UART supports IrDA features. Each UART can be used for configuration and data exchange with a number of external peripheral devices or interprocessor communication between devices

The UART<sub>i</sub> (where *i* = 1 to 10) include the following features:

- 16C750 compatibility
- 64-byte FIFO buffer for receiver and 64-byte FIFO for transmitter
- Baud generation based on programmable divisors *N* (where *N* = 1...16 384) operating from a fixed functional clock of 48 MHz or 192 MHz
- Break character detection and generation
- Configurable data format:
  - Data bit: 5, 6, 7, or 8 bits
  - Parity bit: Even, odd, none
  - Stop-bit: 1, 1.5, 2 bit(s)
- Flow control: Hardware (RTS/CTS) or software (XON/XOFF)
- Only UART1 module has extended modem control signals (DCD, RI, DTR, DSR)
- Only UART3 supports IrDA

**NOTE**

For more information, see the UART/IrDA/CIR section of the Device TRM.

## 7.15 Multichannel Serial Peripheral Interface (McSPI)

The McSPI is a master/slave synchronous serial bus. There are four separate McSPI modules (SPI1, SPI2, SPI3, and SPI4) in the device. All these four modules support up to four external devices (four chip selects) and are able to work as both master and slave.

The McSPI modules include the following main features:

- Serial clock with programmable frequency, polarity, and phase for each channel
- Wide selection of SPI word lengths, ranging from 4 to 32 bits
- Up to four master channels, or single channel in slave mode
- Master multichannel mode:
  - Full duplex/half duplex
  - Transmit-only/receive-only/transmit-and-receive modes
  - Flexible input/output (I/O) port controls per channel
  - Programmable clock granularity
  - SPI configuration per channel. This means, clock definition, polarity enabling and word width
- Power management through wake-up capabilities
- Programmable timing control between chip select and external clock generation
- Built-in FIFO available for a single channel.
- Each SPI module supports multiple chip select pins  $\text{spim\_cs}[i]$ , where  $i = 1$  to 4.

### NOTE

For more information, see the Serial Communication Interface section of the device TRM.

**NOTE**

The McSPIm module (m = 1 to 4) is also referred to as SPIm.

**CAUTION**

The IO timings provided in this section are applicable for all combinations of signals for SPI1 and SPI2. However, the timings are only valid for SPI3 and SPI4 if signals within a single IOSET are used. The IOSETS are defined in the [Table 7-45](#).

[Table 7-43](#), [Figure 7-33](#) and [Figure 7-34](#) present Timing Requirements for McSPI - Master Mode.

(1) This timing applies to all configurations regardless of SPI\_CLK polarity and which clock edges are used to drive output data and capture input data.

(2) Related to the SPI\_CLK maximum frequency.

(3) 20.8ns cycle time = 48MHz, 26ns cycle time = 38.4MHz

(4) P = SPICLK period.

(5) SPI\_CLK phase is programmable with the PHA bit of the SPI\_CH(i)CONF register.

(6)  $B = (TCS + 0.5) * TSPICLKREF * Fratio$ , where TCS is a bit field of the SPI\_CH(i)CONF register and Fratio = Even  $\geq 2$ .

(7) When P = 20.8 ns,  $A = (TCS + 1) * TSPICLKREF$ , where TCS is a bit field of the SPI\_CH(i)CONF register. When P > 20.8 ns,  $A = (TCS + 0.5) * Fratio * TSPICLKREF$ , where TCS is a bit field of the SPI\_CH(i)CONF register.

(8) The IO timings provided in this section are applicable for all combinations of signals for spi1 and spi2. However, the timings are only valid for spi3 and spi4 if signals within a single IOSET are used. The IOSETS are defined in the following tables.

## 7.16 Quad Serial Peripheral Interface (QSPI)

The Quad SPI (QSPI) module is a type of SPI module that allows single, dual or quad read access to external SPI devices. This module has a memory mapped register interface, which provides a direct interface for accessing data from external SPI devices and thus simplifying software requirements. It works as a master only. There is one QSPI module in the device and it is primary intended for fast booting from quad-SPI flash memories.

General SPI features:

- Programmable clock divider
- Six pin interface (DCLK, CS\_N, DOUT, DIN, QDIN1, QDIN2)
- 4 external chip select signals
- Support for 3-, 4- or 6-pin SPI interface
- Programmable CS\_N to DOUT delay from 0 to 3 DCLKs
- Programmable signal polarities
- Programmable active clock edge
- Software controllable interface allowing for any type of SPI transfer

### NOTE

For more information, see the Quad Serial Peripheral Interface section of the Device TRM.

### CAUTION

The IO Timings provided in this section are only valid for some QSPI usage modes when the corresponding Virtual IO Timings or Manual IO Timings are configured as described in the tables found in this section.

### CAUTION

The IO Timings provided in this section are only valid when all QSPI Chip Selects used in a system are configured to use the same Clock Mode (either Clock Mode 0 or Clock Mode3).

(1) The Y parameter is defined as follows:

If DCLK\_DIV is 0 or ODD then, Y equals 0.5.

If DCLK\_DIV is EVEN then, Y equals  $(\text{DCLK\_DIV}/2) / (\text{DCLK\_DIV}+1)$ .

For best performance, it is recommended to use a DCLK\_DIV of 0 or ODD to minimize the duty cycle distortion. The HSDIVIDER on CLKOUTX2\_H13 output of DPLL\_PER can be used to achieve the desired clock divider ratio. All required details about clock division factor DCLK\_DIV can be found in the device TRM.

(2) P = SCLK period.

(3) M=QSPI\_SPI\_DC\_REG.DDx + 1 when Clock Mode 0.

M=QSPI\_SPI\_DC\_REG.DDx when Clock Mode 3.

N = 2 when Clock Mode 0.

N = 3 when Clock Mode 3.

- (1) P = SCLK period.
- (2) Clock Modes 1 and 2 are not supported.
- (3) The Device captures data on the falling clock edge in Clock Mode 0 and 3, as opposed to the traditional rising clock edge. Although nonstandard, the falling-edge-based setup and hold time timings have been designed to be compatible with standard SPI devices that launch data on the falling edge in Clock Modes 0 and 3.

**NOTE**

To configure the desired Manual IO Timing Mode the user must follow the steps described in section Manual IO Timing Modes of the Device TRM.

The associated registers to configure are listed in the **CFG REGISTER** column. For more information see the Control Module chapter in the Device TRM.

Manual IO Timings Modes must be used to ensure some IO timings for QSPI. See [Table 7-2 Modes Summary](#) for a list of IO timings requiring the use of Manual IO Timings Modes. See [Table 7-48 Manual Functions Mapping for QSPI](#) for a definition of the Manual modes.

[Table 7-48](#) lists the A\_DELAY and G\_DELAY values needed to calculate the correct values to be set in the CFG\_x registers.

### 7.17 Multichannel Audio Serial Port (McASP)

The multichannel audio serial port (McASP) functions as a general-purpose audio serial port optimized for the needs of multichannel audio applications. The McASP is useful for time-division multiplexed (TDM) stream, Inter-Integrated Sound (I2S) protocols, and inter-component digital audio interface transmission (DIT).

The device have integrated 8 McASP modules (McASP1-McASP8) with:

- McASP1 and McASP2 modules supporting 16 channels with independent TX/RX clock/sync domain
- McASP3 through McASP8 modules supporting 4 channels with independent TX/RX clock/sync domain

**NOTE**

For more information, see the Multichannel Audio Serial Port section of the Device TRM.

**CAUTION**

The IO Timings provided in this section are only valid for some McASP usage modes when the corresponding Virtual IO Timings or Manual IO Timings are configured as described in the tables found in this section.

**NOTE**

To configure the desired virtual mode the user must set MODESELECT bit and DELAYMODE bitfield for each corresponding pad control register.

The pad control registers are presented in [Table 4-3](#) and described in Device TRM, *Chapter 18 - Control Module*.

[Table 7-55](#) through [Table 7-62](#) explain all cases with Virtual Mode Details for McASP1/2/3/4/5/6/7/8 (see [Figure 7-43](#) through [Figure 7-50](#)).

- (1) Used up to 50MHz. Should also be used in a CI-FI- mixed case where AXR operate as both inputs and outputs (that is, AXR are bidirectional).
- (2) Used in 80MHz input only mode when AXR, CLKX and FSX are all inputs.

1. NA in this table stands for Not Applicable.

Virtual IO Timings Modes must be used to ensure some IO timings for McASP3/4/5/6/7/8. See [Table 7-2 Modes Summary](#) for a list of IO timings requiring the use of Virtual IO Timings Modes. See [Table 7-65 Virtual Functions Mapping for McASP3/4/5/6/7/8](#) for a definition of the Virtual modes.

## 7.18 Universal Serial Bus (USB)

SuperSpeed USB DRD Subsystem has two instances in the device providing the following functions:

- USB1: SuperSpeed (SS) USB 3.0 Dual-Role-Device (DRD) subsystem with integrated SS (USB3.0) PHY and HS/FS (USB2.0) PHY.
- USB2: High-Speed (HS) USB 2.0 Dual-Role-Device (DRD) subsystem with integrated HS/FS PHY.

---

### NOTE

For more information, see the SuperSpeed USB DRD section of the Device TRM.

---

### 7.18.1 USB1 DRD PHY

The USB1 DRD interface supports the following applications:

- USB2.0 High-Speed PHY port (1.8 V and 3.3 V): this asynchronous high-speed interface is compliant with the USB2.0 PHY standard with an internal transceiver (USB2.0 standard v2.0), for a maximum data rate of 480 Mbps.
- USB3.0 Super-Speed PHY port (1.8 V): this asynchronous differential super-speed interface is compliant with the USB3.0 RX/TX PHY standard (USB3.0 standard v1.0) for a maximum data bit rate of 5Gbps.

### 7.18.2 USB2 PHY

The USB2 interface supports the following applications:

- USB2.0 High-Speed PHY port (1.8 V and 3.3 V): this asynchronous high-speed interface is compliant with the USB2.0 PHY standard with an internal transceiver (USB2.0 standard v2.0), for a maximum data rate of 480 Mbps.

## 7.19 Serial Advanced Technology Attachment (SATA)

The SATA RX/TX PHY interface is compliant with the SATA standard v2.6 for a maximum data rate:

- Gen2i, Gen2m, Gen2x: 3Gbps.
- Gen1i, Gen1m, Gen1x: 1.5Gbps.

---

### NOTE

For more information, see the SATA Controller section of the Device TRM.

## 7.20 Peripheral Component Interconnect Express (PCIe)

The device supports connections to PCIe-compliant devices via the integrated PCIe master/slave bus interface. The PCIe module is comprised of a dual-mode PCIe core and a SerDes PHY. Each PCIe subsystem controller has support for PCIe Gen-II mode (5 Gbps per lane) and Gen-I mode (2.5 Gbps per lane) (Single Lane and Flexible dual lane configuration).

The device PCIe supports the following features:

- 16-bit operation @250 MHz on PIPE interface (per 16-bit lane)
- Supports 2 ports x 1 lane or 1 port x 2 lanes configuration
- Single virtual channel (VC0), single traffic class (TC0)
- Single function in end-point mode
- Automatic width and speed negotiation
- Max payload: 128 byte outbound, 256 byte inbound
- Automatic credit management

- ECRC generation and checking
- Configurable BAR filtering
- Legacy interrupt reception (RC) and generation (EP)
- MSI generation and reception
- PCI Express Active State Power Management (ASPM) state L0s and L1 (with exceptions)
- All PCI Device Power Management D-states with the exception of D3<sub>cold</sub> / L2 state

The PCIe controller on this device conforms to the PCI Express Base 3.0 Specification, revision 1.0 and the PCI Local Bus Specification, revision 3.0.

**NOTE**

For more information, see the PCIe Controller section of the Device TRM.

**7.21 Controller Area Network Interface (DCAN)**

The device provides two DCAN interfaces for supporting distributed realtime control with a high level of security. The DCAN interfaces implement the following features:

- Supports CAN protocol version 2.0 part A, B
- Bit rates up to 1 MBit/s
- 64 message objects
- Individual identifier mask for each message object
- Programmable FIFO mode for message objects
- Programmable loop-back modes for self-test operation
- Suspend mode for debug support
- Software module reset
- Automatic bus on after Bus-Off state by a programmable 32-bit timer
- Direct access to Message RAM during test mode
- CAN Rx/Tx pins are configurable as general-purpose IO pins
- Two interrupt lines (plus additional parity-error interrupts line)
- RAM initialization
- DMA support

**NOTE**

For more information, see the DCAN section of the Device TRM.

**NOTE**

The Controller Area Network Interface x (x = 1 to 2) is also referred to as DCANx.

**NOTE**

Refer to the CAN Specification for calculations necessary to validate timing compliance. Jitter tolerance calculations must be performed to validate the implementation.

Table 7-66 and Table 7-67 present timing and switching characteristics for DCANx Interface.

(1) These values do not include rise/fall times of the output buffer.

## 7.22 Ethernet Interface (GMAC\_SW)

The three-port gigabit ethernet switch subsystem (GMAC\_SW) provides ethernet packet communication and can be configured as an ethernet switch. It provides the Gigabit Media Independent Interface (G/MII) in MII mode, Reduced Gigabit Media Independent Interface (RGMII), Reduced Media Independent Interface (RMII), and the Management Data Input/Output (MDIO) for physical layer device (PHY) management.

### NOTE

For more information, see the Gigabit Ethernet Switch (GMAC\_SW) section of the Device TRM.

### NOTE

The Gigabit, Reduced and Media Independent Interface n (n = 0 to 1) are also referred to as MII<sub>n</sub>, RMII<sub>n</sub> and RGMII<sub>n</sub>.

### CAUTION

The IO timings provided in this section are only valid if signals within a single IOSET are used. The IOSETs are defined in the [Table 7-72](#), [Table 7-75](#), [Table 7-80](#) and [Table 7-87](#).

### CAUTION

The IO Timings provided in this section are only valid for some GMAC usage modes when the corresponding Virtual IO Timings or Manual IO Timings are configured as described in the tables found in this section.

[Table 7-68](#) and [Figure 7-51](#) present timing requirements for MII<sub>n</sub> in receive operation.

### 7.22.3 GMAC RMII Timings

The main reference clock REF\_CLK (RMII\_50MHZ\_CLK) of RMII interface is internally supplied from PRCM. The source of this clock could be either externally sourced from the RMII\_MHZ\_50\_CLK pin of the device or internally generated from DPLL\_GMAC output clock GMAC\_RMII\_HS\_CLK. See the PRCM chapter of the device TRM for full details about RMII reference clock.

**CAUTION**

The IO Timings provided in this section are only valid for some GMAC usage modes when the corresponding Virtual IO Timings or Manual IO Timings are configured as described in the tables found in this section.

Table 7-76, Table 7-77 and Figure 7-56 present timing requirements for GMAC RMII Receive.

### 7.22.4 GMAC RGMII Timings

#### CAUTION

The IO Timings provided in this section are only valid for some GMAC usage modes when the corresponding Virtual IO Timings or Manual IO Timings are configured as described in the tables found in this section.

Table 7-83, Table 7-84 and Figure 7-58 present timing requirements for receive RGMII operation.

**Table 7-84. Timing Requirements for GMAC RGMII Input Receive for 10/100/1000 Mbps <sup>(1)</sup>**

| NO. | PARAMETER          | DESCRIPTION   | MIN | MAX | UNIT |
|-----|--------------------|---|-----|-----|------|
| 5   | $t_{su(RXD-RXCH)}$ | Setup time, receive selected signals valid before rgmiin_rxc high/low | 1   |     | ns   |
| 6   | $t_{h(RXCH-RXD)}$  | Hold time, receive selected signals valid after rgmiin_rxc high/low   | 1   |     | ns   |

(1) For RGMII, receive selected signals include: rgmiin\_rxd[3:0] and rgmiin\_rxctl.

- A. rgmiin\_rxc must be externally delayed relative to the data and control pins.
- B. Data and control information is received using both edges of the clocks. rgmiin\_rxd[3:0] carries data bits 3-0 on the rising edge of rgmiin\_rxc and data bits 7-4 on the falling edge of rgmiin\_rxc. Similarly, rgmiin\_rxctl carries RXDV on rising edge of rgmiin\_rxc and RXERR on falling edge of rgmiin\_rxc.

- (1) For RGMII, transmit selected signals include: rgmiin\_txd[3:0] and rgmiin\_txctl.
- (2) RGMIIO 1000Mbps operation requires that the 4 data pins rgmiio\_txd[3:0] and rgmiio\_txctl have their board propagation delays matched within 50pS of rgmiio\_txc.
- (3) RGMI11 1000Mbps operation requires that the 4 data pins rgmi11\_txd[3:0] and rgmi11\_txctl have their board propagation delays matched within 50pS of rgmi11\_txc.

- A. TxC is delayed internally before being driven to the rgmiin\_txc pin. This internal delay is always enabled.
- B. Data and control information is transmitted using both edges of the clocks. rgmiin\_txd[3:0] carries data bits 3-0 on the rising edge of rgmiin\_txc and data bits 7-4 on the falling edge of rgmiin\_txc. Similarly, rgmiin\_txctl carries TXEN on rising edge of rgmiin\_txc and TXERR of falling edge of rgmiin\_txc.

**NOTE**

To configure the desired Manual IO Timing Mode the user must follow the steps described in section Manual IO Timing Modes of the Device TRM.

The associated registers to configure are listed in the **CFG REGISTER** column. For more information see the Control Module chapter in the Device TRM.

Manual IO Timings Modes must be used to ensure some IO timings for GMAC. See [Table 7-2 Modes Summary](#) for a list of IO timings requiring the use of Manual IO Timings Modes. See [Table 7-88 Manual Functions Mapping for GMAC RGMII0](#) for a definition of the Manual modes.

[Table 7-88](#) lists the A\_DELAY and G\_DELAY values needed to calculate the correct values to be set in the CFG\_x registers.

## 7.23 eMMC/SD/SDIO

The Device includes the following external memory interfaces 4 MultiMedia Card/Secure Digital/Secure Digital Input Output Interface (MMC/SD/SDIO).

### NOTE

The eMMC/SD/SDIO<sub>i</sub> (i = 1 to 4) controller is also referred to as MMC<sub>i</sub>.

### 7.23.1 MMC1—SD Card Interface

MMC1 interface is compliant with the SD Standard v3.01 and it supports the following SD Card applications:

- Default speed, 4-bit data, SDR, half-cycle
- High speed, 4-bit data, SDR, half-cycle
- SDR12, 4-bit data, half-cycle
- SDR25, 4-bit data, half-cycle
- UHS-I SDR50, 4-bit data, half-cycle
- UHS-I SDR104, 4-bit data, half-cycle
- UHS-I DDR50, 4-bit data

### NOTE

For more information, see the eMMC/SD/SDIO chapter of the Device TRM.

**NOTE**

To configure the desired virtual mode the user must set MODESELECT bit and DELAYMODE bitfield for each corresponding pad control register.

The pad control registers are presented in [Table 4-3](#) and described in Device TRM, *Control Module Chapter*.

Virtual IO Timings Modes must be used to ensure some IO timings for MMC1. See [Table 7-2 Modes Summary](#) for a list of IO timings requiring the use of Virtual IO Timings Modes. See [Table 7-103 Virtual Functions Mapping for MMC1](#) for a definition of the Virtual modes.

[Table 7-103](#) presents the values for DELAYMODE bitfield.

**NOTE**

To configure the desired Manual IO Timing Mode the user must follow the steps described in section Manual IO Timing Modes of the Device TRM.

The associated registers to configure are listed in the **CFG REGISTER** column. For more information see the Control Module chapter in the Device TRM.

### 7.23.2 MMC2 — eMMC

MMC2 interface is compliant with the JC64 eMMC Standard v4.5 and it supports the following eMMC applications:

- Standard JC64 SDR, 8-bit data, half cycle
- High-speed JC64 SDR, 8-bit data, half cycle
- High-speed JC64 DDR, 8-bit data
- High-speed HS200 JC64 SDR, 8-bit data, half cycle

#### NOTE

For more information, see the eMMC/SD/SDIO chapter of the Device TRM.

#### 7.23.2.1 Standard JC64 SDR, 8-bit data, half cycle

| DDR4 | $t_{h(clk-cmdV)}$  | Hold time, mmc2_cmd valid after mmc2_clk transition        |                     | 1.8     |     | ns   |
| DDR7 | $t_{su(dV-clk)}$   | Setup time, mmc2_dat[7:0] valid before mmc2_clk transition |                     | 1.8     |     | ns   |
| DDR8 | $t_{h(clk-dV)}$    | Hold time, mmc2_dat[7:0] valid after mmc2_clk transition   | Pad Loopback (1.8V) | 1.8 (1) |     | ns   |
|      |                    |  | Pad Loopback (3.3V) | 1.8     |     | ns   |
|      |                    |  | Internal Loopback   | 1.8 (1) |     | ns   |

(1) This Hold time requirement is larger than the Hold time provided by a typical eMMC component. Therefore, the trace length between the Device and eMMC component must be sufficiently long enough to ensure that the Hold time is met at the Device.

**NOTE**

To configure the desired Manual IO Timing Mode the user must follow the steps described in section Manual IO Timing Modes of the Device TRM.

The associated registers to configure are listed in the **CFG REGISTER** column. For more information see the Control Module chapter in the Device TRM.

Manual IO Timings Modes must be used to ensure some IO timings for MMC2. See [Table 7-2 Modes Summary](#) for a list of IO timings requiring the use of Manual IO Timings Modes. See [Table 7-114 Manual Functions Mapping for MMC2 With Internal Loopback Clock and for HS200](#) for a definition of the Manual modes.

[Table 7-114](#) lists the A\_DELAY and G\_DELAY values needed to calculate the correct values to be set in the CFG\_x registers.

### 7.2.3.3 MMC3 and MMC4—SDIO/SD

MMC3 and MMC4 interfaces are compliant with the SDIO3.0 standard v1.0, SD Part E1 and for generic SDIO devices, it supports the following applications:

- MMC3 8-bit data and MMC4 4-bit data, SD Default speed, SDR
- MMC3 8-bit data and MMC4 4-bit data, SD High speed, SDR
- MMC3 8-bit data and MMC4 4-bit data, UHS-1 SDR12 (SD Standard v3.01), 4-bit data, SDR, half cycle
- MMC3 8-bit data and MMC4 4-bit data, UHS-I SDR25 (SD Standard v3.01), 4-bit data, SDR, half cycle
- MMC3 8-bit data, UHS-I SDR50

**NOTE**

The eMMC/SD/SDIOj (j = 3 to 4) controller is also referred to as MMCj.

**NOTE**

For more information, see the MMC/SDIO chapter of the Device TRM.

#### 7.2.3.3.1 MMC3 and MMC4, SD Default Speed

Figure 7-81, Figure 7-82, and Table 7-115 through Table 7-118 present Timing requirements and Switching characteristics for MMC3 and MMC4 - SD Default speed in receiver and transmitter mode.

**NOTE**

To configure the desired Manual IO Timing Mode the user must follow the steps described in section Manual IO Timing Modes of the Device TRM.

The associated registers to configure are listed in the **CFG REGISTER** column. For more information see the Control Module chapter in the Device TRM.

Manual IO Timings Modes must be used to ensure some IO timings for MMC3. See [Table 7-2 Modes Summary](#) for a list of IO timings requiring the use of Manual IO Timings Modes. See [Table 7-133 Manual Functions Mapping for MMC3](#) for a definition of the Manual modes.

[Table 7-133](#) lists the A\_DELAY and G\_DELAY values needed to calculate the correct values to be set in the CFG\_x registers.

Manual IO Timings Modes must be used to ensure some IO timings for MMC4. See [Table 7-2 Modes Summary](#) for a list of IO timings requiring the use of Manual IO Timings Modes. See [Table 7-134 Manual Functions Mapping for MMC4](#) for a definition of the Manual modes.

[Table 7-134](#) lists the A\_DELAY and G\_DELAY values needed to calculate the correct values to be set in the CFG\_x registers.

## 7.24 General-Purpose Interface (GPIO)

The general-purpose interface combines eight general-purpose input/output (GPIO) banks. Each GPIO module provides 32 dedicated general-purpose pins with input and output capabilities; thus, the general-purpose interface supports up to 247 pins.

These pins can be configured for the following applications:

- Data input (capture)/output (drive)
- Keyboard interface with a debounce cell
- Interrupt generation in active mode upon the detection of external events. Detected events are processed by two parallel independent interrupt-generation submodules to support biprocessor operations
- Wake-up request generation in idle mode upon the detection of external events

---

### NOTE

For more information, see the General-Purpose Interface chapter of the Device TRM.

---

---

### NOTE

The general-purpose input/output  $i$  ( $i = 1$  to 8) bank is also referred to as GPIO $i$ .

## 7.25 Programmable Real-Time Unit Subsystem and Industrial Communication Subsystem (PRU-ICSS)

The device Programmable Real-Time Unit and Industrial Communication Subsystem (PRU-ICSS) consists of dual 32-bit Load / Store RISC CPU cores - Programmable Real-Time Units (PRU0 and PRU1), shared, data, and instruction memories, internal peripheral modules, and an interrupt controller (PRU-ICSS\_INTC). The programmable nature of the PRUs, along with their access to pins, events and all SoC resources, provides flexibility in implementing fast real-time responses, specialized data handling operations, customer peripheral interfaces, and in off-loading tasks from the other processor cores of the system-on-chip (SoC).

The each PRU-ICSS includes the following main features:

- 21x Enhanced GPIs (EGPIs) and 21x Enhanced GPOs (EGPOs) with asynchronous capture and serial support per each PRU CPU core
- One Ethernet MII\_RT module (PRU-ICSS\_MII\_RT) with two MII ports and configurable connections to PRUs
- 1 MDIO Port (PRU-ICSS\_MII\_MDIO)
- One Industrial Ethernet Peripheral (IEP) to manage/generate Industrial Ethernet functions
- 1 x 16550-compatible UART with a dedicated 192 MHz clock to support 12Mbps Profibus
- 1 Industrial Ethernet timer with 7/9 capture and 8 compare events
- 1 Enhanced Capture Module (ECAP)
- 1 Interrupt Controller (PRU-ICSS\_INTC)
- A flexible power management support
- Integrated switched central resource with programmable priority
- Parity control supported by all memories

#### CAUTION

The IO timings provided in this section are only valid if signals within a single IOSET are used. The IOSETs are defined in the [Table 7-154](#) and [Table 7-155](#).

#### NOTE

For more information about PRU-ICSS subsystems interfaces, see the device TRM.

#### NOTE

To configure the desired virtual mode the user must set MODESELECT bit and DELAYMODE bitfield for each corresponding pad control register.

The pad control registers are presented in [Table 4-3](#) and described in Device TRM, *Chapter 18 - Control Module*.

### 7.25.3.2 PRU-ICSS MII\_RT Electrical Data and Timing

**NOTE**

In order to ensure the MII\_RT IO timing values published in the device data manual, the PRUSS\_GICLK clock must be configured for 200MHz (default value) and the TX\_CLK\_DELAY bitfield in the PRUSS\_MII\_RT\_TXCFG0/1 register must be configured as follows:

- 100 Mbps mode: 6h (non-default value)
- 10 Mbps mode: 0h (default value)

## 7.2.5.6 PRU-ICSS Manual Functional Mapping

### NOTE

To configure the desired Manual IO Timing Mode the user must follow the steps described in section "Manual IO Timing Modes" of the Device TRM.

The associated registers to configure are listed in the **CFG REGISTER** column. For more information see the *Control Module Chapter* in the Device TRM.

Manual IO Timings Modes must be used to ensure some IO timings for PRU-ICSS1 PRU0 Direct Output mode. See [Table 7-2 Modes Summary](#) for a list of IO timings requiring the use of Manual IO Timings Modes. See [Table 7-156 Manual Functions Mapping for PRU-ICSS1 PRU0 Direct Output mode](#) for a definition of the Manual modes.

[Table 7-156](#) lists the A\_DELAY and G\_DELAY values needed to calculate the correct values to be set in the CFG\_x registers.

## 7.26 System and Miscellaneous interfaces

The Device includes the following System and Miscellaneous interfaces:

- Sysboot Interface
- System DMA Interface
- Interrupt Controllers (INTC) Interface
- Observability Signal (OBS) Interface

## 7.27 Test Interfaces

The Device includes the following Test interfaces:

- IEEE 1149.1 Standard-Test-Access Port (JTAG)
- Trace Port Interface Unit (TPIU)
- Advanced Event Triggering Interface (AET)

### 7.27.1 IEEE 1149.1 Standard-Test-Access Port (JTAG)

The JTAG (IEEE Standard 1149.1-1990 Standard-Test-Access Port and Boundary Scan Architecture) interface is used for BSDL testing and emulation of the device. The *trstn* pin only needs to be released when it is necessary to use a JTAG controller to debug the device or exercise the device's boundary scan functionality. For maximum reliability, the device includes an internal Pulldown (IPD) on the *trstn* pin to ensure that *trstn* is always asserted upon power up and the device's internal emulation logic is always properly initialized. JTAG controllers from Texas Instruments actively drive *trstn* high. However, some third-party JTAG controllers may not drive *trstn* high but expect the use of a pullup resistor on *trstn*. When using this type of JTAG controller, assert *trstn* to initialize the device after powerup and externally drive *trstn* high before attempting any emulation or boundary-scan operations.

The main JTAG features include:

- 32KB Embedded Trace Buffer (ETB™)
- 5-pin system trace interface for debug
- Supports Advanced Event Triggering (AET)
- All processors can be emulated via JTAG ports
- All functions on EMU pins of the device:
  - EMU[1:0] - cross-triggering, boot mode (WIR), STM trace
  - EMU[4:2] - STM trace only (single direction)

## 8 Applications, Implementation, and Layout

### NOTE

Information in the following applications sections is not part of the TI component specification, and TI does not warrant its accuracy or completeness. TI's customers are responsible for determining suitability of components for their purposes. Customers should validate and test design implementation to confirm system functionality.

### 8.1 Power Supply Mapping

TPS659037 is the Power Management IC (PMIC) that should be used for the Device designs. TI requires use of this PMIC for the following reasons:

- TI has validated its use with the Device
- Board level margins including transient response and output accuracy are analyzed and optimized for the entire system
- Support for power sequencing requirements (refer to [Section 5.9 Power Supply Sequences](#))
- Support for Adaptive Voltage Scaling (AVS) Class 0 requirements, including TI provided software

Whenever we allow for combining of rails mapped on any of the SMPSes, the PDN guidelines that are the most stringent of the rails combined should be implemented for the particular supply rail.

It is possible that some voltage domains on the device are unused in some systems. In such cases, to ensure device reliability, it is still required that the supply pins for the specific voltage domains are connected to some core power supply output.

These unused supplies though can be combined with any of the core supplies that are used (active) in the system. e.g. if IVA and GPU domains are not used, they can be combined with the CORE domain, thereby having a single power supply driving the combined CORE, IVA and GPU domains.

For the combined rail, the following relaxations do apply:

- The AVS voltage of active rail in the combined rail needs to be used to set the power supply
- The decoupling capacitance should be set according to the active rail in the combined rail

[Table 8-1](#) illustrates the approved and validated power supply connections to the Device for the SMPS outputs of the TPS659037 PMIC.

- (1) Power consumption is highly application-specific. Separate analysis must be performed to ensure output current ratings (average and peak) is within the limits of the PMIC for all rails of the device.
- (2) Refer to the PMIC data manual for the latest TPS659037 specifications
- (3) For more information on connectivity with the TPS659037 PMIC, see the TPS659037 User's Guide to Power AM572x (SLIU011).
- (4) A product's maximum ambient temperature, thermal system design & heat spreading performance could limit the maximum power dissipation below the full PMIC capacity in order to not exceed recommended SoC max Tj

## 8.2 DDR3 Board Design and Layout Guidelines

### 8.2.1 DDR3 General Board Layout Guidelines

To help ensure good signaling performance, consider the following board design guidelines:

- Avoid crossing splits in the power plane.
- Minimize Vref noise.
- Use the widest trace that is practical between decoupling capacitors and memory module.
- Maintain a single reference.
- Minimize ISI by keeping impedances matched.
- Minimize crosstalk by isolating sensitive bits, such as strobes, and avoiding return path discontinuities.
- Use proper low-pass filtering on the Vref pins.
- Keep the stub length as short as possible.
- Add additional spacing for on-clock and strobe nets to eliminate crosstalk.
- Maintain a common ground reference for all bypass and decoupling capacitors.
- Take into account the differences in propagation delays between microstrip and stripline nets when evaluating timing constraints.

### 8.2.2 DDR3 Board Design and Layout Guidelines

#### 8.2.2.1 Board Designs

TI only supports board designs using DDR3 memory that follow the guidelines in this document. The switching characteristics and timing diagram for the DDR3 memory controller are shown in [Table 8-2](#) and [Figure 8-1](#).

**Table 8-2. Switching Characteristics Over Recommended Operating Conditions for DDR3 Memory Controller**

| NO. | PARAMETER         |                     | MIN   | MAX                | UNIT |
|-----|-------------------|---------------------|-------|--------------------|------|
| 1   | $t_{c(DDR\_CLK)}$ | Cycle time, DDR_CLK | 1.875 | 2.5 <sup>(1)</sup> | ns   |

- (1) This is the absolute maximum the clock period can be. Actual maximum clock period may be limited by DDR3 speed grade and operating frequency (see the DDR3 memory device data sheet).

**Figure 8-1. DDR3 Memory Controller Clock Timing**

#### 8.2.2.2 DDR3 EMIFs

The processor contains two separate DDR3 EMIFs. This specification covers one of these EMIFs (ddr1\_\*) and, thus, needs to be implemented twice, once for each EMIF. The PCB layout generally turns out to be a semi-mirror with ddr2\_\* being a flipped version of ddr1\_\*; the only exception being the DDR3 devices themselves are not flipped unless mounted on opposite sides of the PCB. Requirements are identical between the two EMIFs.

### 8.2.2.3 DDR3 Device Combinations

Because there are several possible combinations of device counts and single- or dual-side mounting, [Table 8-3](#) summarizes the supported device configurations.

**Table 8-3. Supported DDR3 Device Combinations<sup>(1)</sup>**

| NUMBER OF DDR3 DEVICES | DDR3 DATA DEVICE WIDTH (BITS) | MIRRORED?        | DDR3 EMIF WIDTH (BITS) |
|------------------------|-------------------------------|------------------|------------------------|
| 1                      | 16                            | N                | 16                     |
| 2                      | 8                             | Y <sup>(2)</sup> | 16                     |
| 2                      | 16                            | N                | 32                     |
| 2                      | 16                            | Y <sup>(2)</sup> | 32                     |
| 3                      | 16                            | N <sup>(4)</sup> | 32                     |
| 4                      | 8                             | N                | 32                     |
| 4                      | 8                             | Y <sup>(3)</sup> | 32                     |
| 5                      | 8                             | N <sup>(4)</sup> | 32                     |

(1) This table is per EMIF.

(2) Two DDR3 devices are mirrored when one device is placed on the top of the board and the second device is placed on the bottom of the board.

(3) This is two mirrored pairs of DDR3 devices.

(4) The DDR memory connected to the DDR ECC bus does NOT need to be the same part number as the DDR memories connected to the DDR data bus. However, some constraints do apply. When selecting a memory for the DDR ECC bus, the following restrictions must be adhered to as compared to the DDR memories on the data bus:

- Match the same DDR3 speed grade
- Have an equal number of internal banks
- Have an equal number of columns
- Have a greater or equal number of rows

### 8.2.2.4 DDR3 Interface Schematic

#### 8.2.2.4.1 32-Bit DDR3 Interface

The DDR3 interface schematic varies, depending upon the width of the DDR3 devices used and the width of the bus used (16 or 32 bits). General connectivity is straightforward and very similar. 16-bit DDR devices look like two 8-bit devices. [Figure 8-2](#) and [Figure 8-3](#) show the schematic connections for 32-bit interfaces using x16 devices.

#### 8.2.2.4.2 16-Bit DDR3 Interface

Note that the 16-bit wide interface schematic is practically identical to the 32-bit interface (see [Figure 8-2](#) and [Figure 8-3](#)); only the high-word DDR memories are removed and the unused DQS inputs are tied off.

When not using all or part of a DDR interface, the proper method of handling the unused pins is to tie off the `ddrx_dqsi` pins to ground via a 1k-Ω resistor and to tie off the `ddrx_dqsn/` pins to the corresponding `vdds_ddrx` supply via a 1k-Ω resistor. This needs to be done for each byte not used. Although these signals have internal pullups and pulldowns, external pullups and pulldowns provide additional protection against external electrical noise causing activity on the signals.

The `vdds_ddrx` and `ddrx_vref0` power supply pins need to be connected to their respective power supplies even if `ddrx` is not being used. All other DDR interface pins can be left unconnected. Note that the supported modes for use of the DDR EMIF are 32-bits wide, 16-bits wide, or not used.

### 8.2.2.5 Compatible JEDEC DDR3 Devices

Table 8-4 shows the parameters of the JEDEC DDR3 devices that are compatible with this interface. Generally, the DDR3 interface is compatible with DDR3-1066 devices in the x8 or x16 widths.

**Table 8-4. Compatible JEDEC DDR3 Devices (Per Interface)**

| N O. | PARAMETER                                    | CONDITION                        | MIN       | MAX       | UNIT    |
|------|--|----------------------------------|-----------|-----------|---------|
| 1    | JEDEC DDR3 device speed grade <sup>(1)</sup> | DDR clock rate = 400MHz          | DDR3-800  | DDR3-1600 |         |
|      |  | 400MHz < DDR clock rate ≤ 533MHz | DDR3-1066 | DDR3-1600 |         |
| 2    | JEDEC DDR3 device bit width                  |                                  | x8        | x16       | Bits    |
| 3    | JEDEC DDR3 device count <sup>(2)</sup>       |                                  | 2         | 4         | Devices |

(1) Refer to Table 8-2 Switching Characteristics Over Recommended Operating Conditions for DDR3 Memory Controller for the range of supported DDR clock rates.

(2) For valid DDR3 device configurations and device counts, see Section 8.2.2.4, Figure 8-2, and Figure 8-3.

### 8.2.2.6 PCB Stackup

The minimum stackup for routing the DDR3 interface is a six-layer stack up as shown in Table 8-5. Additional layers may be added to the PCB stackup to accommodate other circuitry, enhance SI/EMI performance, or to reduce the size of the PCB footprint. Complete stackup specifications are provided in Table 8-6.

**Table 8-5. Six-Layer PCB Stackup Suggestion**

| LAYER | TYPE   | DESCRIPTION                           |
|-------|--------|---------------------------------------|
| 1     | Signal | Top routing mostly vertical           |
| 2     | Plane  | Ground                                |
| 3     | Plane  | Split power plane                     |
| 4     | Plane  | Split power plane or Internal routing |
| 5     | Plane  | Ground                                |
| 6     | Signal | Bottom routing mostly horizontal      |

**Table 8-6. PCB Stackup Specifications**

| NO.  | PARAMETER   | MIN | TYP | MAX | UNIT |
|------|---|-----|-----|-----|------|
| PS1  | PCB routing/plane layers  | 6   |     |     |      |
| PS2  | Signal routing layers   | 3   |     |     |      |
| PS3  | Full ground reference layers under DDR3 routing region <sup>(1)</sup>           | 1   |     |     |      |
| PS4  | Full 1.5-V power reference layers under the DDR3 routing region <sup>(1)</sup>  | 1   |     |     |      |
| PS5  | Number of reference plane cuts allowed within DDR routing region <sup>(2)</sup> |     |     | 0   |      |
| PS6  | Number of layers between DDR3 routing layer and reference plane <sup>(3)</sup>  |     |     | 0   |      |
| PS7  | PCB routing feature size  |     | 4   |     | Mils |
| PS8  | PCB trace width, w  |     | 4   |     | Mils |
| PS9  | Single-ended impedance, Z <sub>0</sub>  | 50  |     | 75  | Ω    |
| PS10 | Impedance control <sup>(5)</sup>  | Z-5 | Z   | Z+5 | Ω    |

- (1) Ground reference layers are preferred over power reference layers. Be sure to include bypass caps to accommodate reference layer return current as the trace routes switch routing layers.
- (2) No traces should cross reference plane cuts within the DDR routing region. High-speed signal traces crossing reference plane cuts create large return current paths which can lead to excessive crosstalk and EMI radiation.
- (3) Reference planes are to be directly adjacent to the signal plane to minimize the size of the return current loop.
- (4) An 18-mil pad assumes Via Channel is the most economical BGA escape. A 20-mil pad may be used if additional layers are available for power routing. An 18-mil pad is required for minimum layer count escape.
- (5) Z is the nominal singled-ended impedance selected for the PCB specified by PS9.

### 8.2.2.7 Placement

Figure 8-4 shows the required placement for the processor as well as the DDR3 devices. The dimensions for this figure are defined in Table 8-7. The placement does not restrict the side of the PCB on which the devices are mounted. The ultimate purpose of the placement is to limit the maximum trace lengths and allow for proper routing space. For a 16-bit DDR memory system, the high-word DDR3 devices are omitted from the placement.

| KOD37 | Clearance from non-DDR3 signal to DDR3 keepout region <sup>(2) (3)</sup> | 4   |      | W    |

- (1) DDR3 keepout region to encompass entire DDR3 routing area.
- (2) Non-DDR3 signals allowed within DDR3 keepout region provided they are separated from DDR3 routing layers by a ground plane.
- (3) If a device has more than one DDR controller, the signals from the other controller(s) are considered non-DDR3 and should be separated by this specification.

### 8.2.2.8 DDR3 Keepout Region

The region of the PCB used for DDR3 circuitry must be isolated from other signals. The DDR3 keepout region is defined for this purpose and is shown in [Figure 8-5](#). The size of this region varies with the placement and DDR routing. Additional clearances required for the keepout region are shown in [Table 8-7](#). Non-DDR3 signals should not be routed on the DDR signal layers within the DDR3 keepout region. Non-DDR3 signals may be routed in the region, provided they are routed on layers separated from the DDR signal layers by a ground layer. No breaks should be allowed in the reference ground layers in this region. In addition, the 1.5-V DDR3 power plane should cover the entire keepout region. Also note that the two signals from the DDR3 controller should be separated from each other by the specification in [Table 8-7](#), (see [KOD37](#)).

**Figure 8-5. DDR3 Keepout Region**

### 8.2.2.9 Bulk Bypass Capacitors

Bulk bypass capacitors are required for moderate speed bypassing of the DDR3 and other circuitry. [Table 8-8](#) contains the minimum numbers and capacitance required for the bulk bypass capacitors. Note that this table only covers the bypass needs of the DDR3 controllers and DDR3 devices. Additional bulk bypass capacitance may be needed for other circuitry.

**Table 8-8. Bulk Bypass Capacitors**

| NO. | PARAMETER  | MIN | MAX | UNIT    |
|-----|--|-----|-----|---------|
| 1   | vdds_ddrx bulk bypass capacitor count <sup>(1)</sup> | 1   |     | Devices |
| 2   | vdds_ddrx bulk bypass total capacitance              | 22  |     | μF      |

(1) These devices should be placed near the devices they are bypassing, but preference should be given to the placement of the high-speed (HS) bypass capacitors and DDR3 signal routing.

### 8.2.2.10 High-Speed Bypass Capacitors

High-speed (HS) bypass capacitors are critical for proper DDR3 interface operation. It is particularly important to minimize the parasitic series inductance of the HS bypass capacitors, processor/DDR power, and processor/DDR ground connections. [Table 8-9](#) contains the specification for the HS bypass capacitors as well as for the power connections on the PCB. Generally speaking, it is good to:

1. Fit as many HS bypass capacitors as possible.
2. Minimize the distance from the bypass cap to the pins/balls being bypassed.
3. Use the smallest physical sized capacitors possible with the highest capacitance readily available.
4. Connect the bypass capacitor pads to their vias using the widest traces possible and using the largest hole size via possible.
5. Minimize via sharing. Note the limites on via sharing shown in [Table 8-9](#).

**Table 8-9. High-Speed Bypass Capacitors**

(7) Per DDR3 device.

(8) An additional HS bypass capacitor can share the connection vias only if it is mounted on the opposite side of the board. No sharing of

vias is permitted on the same side of the board.

- (9) An HS bypass capacitor may share a via with a DDR device mounted on the same side of the PCB. A wide trace should be used for the connection and the length from the capacitor pad to the DDR device pad should be less than 150 mils.
- (10) Up to a total of two pairs of DDR power/ground balls may share a via.

### 8.2.2.10.1 Return Current Bypass Capacitors

Use additional bypass capacitors if the return current reference plane changes due to DDR3 signals hopping from one signal layer to another. The bypass capacitor here provides a path for the return current to hop planes along with the signal. As many of these return current bypass capacitors should be used as possible. Because these are returns for signal current, the signal via size may be used for these capacitors.

### 8.2.2.11 Net Classes

Table 8-10 lists the clock net classes for the DDR3 interface. Table 8-11 lists the signal net classes, and associated clock net classes, for signals in the DDR3 interface. These net classes are used for the termination and routing rules that follow.

**Table 8-10. Clock Net Class Definitions**

| CLOCK NET CLASS     | processor PIN NAMES    |
|---------------------|------------------------|
| CK                  | ddrx_ck / ddrx_nck     |
| DQS0                | ddrx_dqs0 / ddrx_dqsn0 |
| DQS1                | ddrx_dqs1 / ddrx_dqsn1 |
| DQS2 <sup>(1)</sup> | ddrx_dqs2 / ddrx_dqsn2 |
| DQS3 <sup>(1)</sup> | ddrx_dqs3 / ddrx_dqsn3 |

(1) Only used on 32-bit wide DDR3 memory systems.

(1) Only used on 32-bit wide DDR3 memory systems.

### 8.2.2.12 DDR3 Signal Termination

Signal terminators are required for the CK and ADDR\_CTRL net classes. The data lines are terminated by ODT and, thus, the PCB traces should be unterminated. Detailed termination specifications are covered in the routing rules in the following sections.

### 8.2.2.13 VREF\_DDR Routing

ddrx\_vref0 (VREF) is used as a reference by the input buffers of the DDR3 memories as well as the processor. VREF is intended to be half the DDR3 power supply voltage and is typically generated with the DDR3 VDD5 and VTT power supply. It should be routed as a nominal 20-mil wide trace with 0.1  $\mu$ F bypass capacitors near each device connection. Narrowing of VREF is allowed to accommodate routing congestion.

### 8.2.2.14 VTT

Like VREF, the nominal value of the VTT supply is half the DDR3 supply voltage. Unlike VREF, VTT is expected to source and sink current, specifically the termination current for the ADDR\_CTRL net class Thevenin terminators. VTT is needed at the end of the address bus and it should be routed as a power sub-plane. VTT should be bypassed near the terminator resistors.

### 8.2.2.15 CK and ADDR\_CTRL Topologies and Routing Definition

The CK and ADDR\_CTRL net classes are routed in a fly-by topology. They are routed in a similar manner and are length matched to minimize skew between them. CK is a bit more complicated because it runs at a higher transition rate and is differential. The following subsections show the topology and routing for various DDR3 configurations for CK and ADDR\_CTRL. The figures in the following subsections define the terms for the routing specification detailed in Table 8-12. Balanced-T routing is not recommended.

#### 8.2.2.15.1 Four DDR3 Devices

Four DDR3 devices are supported on the DDR EMIF consisting of four x8 DDR3 devices arranged as one bank (CS). These four devices may be mounted on a single side of the PCB, or may be mirrored in two pairs to save board space at a cost of increased routing complexity and parts on the backside of the PCB.

8.2.2.16 Data Topologies and Routing Definition

No matter the number of DDR3 devices used, the data line topology is always point to point, so its definition is simple.

Care should be taken to minimize layer transitions during routing. If a layer transition is necessary, it is better to transition to a layer using the same reference plane. If this cannot be accommodated, ensure there are nearby ground vias to allow the return currents to transition between reference planes if both reference planes are ground or vdds\_ddr. Ensure there are nearby bypass capacitors to allow the return currents to transition between reference planes if one of the reference planes is ground. The goal is to minimize the size of the return current loops.

8.2.2.16.1 DQS and DQ/DM Topologies, Any Number of Allowed DDR3 Devices

DQS lines are point-to-point differential, and DQ/DM lines are point-to-point singled ended. Figure 8-22 and Figure 8-23 show these topologies.

### 8.2.2.17 Routing Specification

#### 8.2.2.17.1 CK and ADDR\_CTRL Routing Specification

Skew within the CK and ADDR\_CTRL net classes directly reduces setup and hold margin and, thus, this skew must be controlled. The only way to practically match lengths on a PCB is to lengthen the shorter traces up to the length of the longest net in the net class and its associated clock. A metric to establish this maximum length is Manhattan distance. The Manhattan distance between two points on a PCB is the length between the points when connecting them only with horizontal or vertical segments. A reasonable trace route length is to within a percentage of its Manhattan distance. CACLM is defined as Clock Address Control Longest Manhattan distance.

Given the clock and address pin locations on the processor and the DDR3 memories, the maximum possible Manhattan distance can be determined given the placement. [Figure 8-26](#) and [Figure 8-27](#) show this distance for four loads and two loads, respectively. It is from this distance that the specifications on the lengths of the transmission lines for the address bus are determined. CACLM is determined similarly for other address bus configurations; that is, it is based on the longest net of the CK/ADDR\_CTRL net class. For CK and ADDR\_CTRL routing, these specifications are contained in [Table 8-12](#).

- A. It is very likely that the longest CK/ADDR\_CTRL Manhattan distance will be for Address Input 8 (A8) on the DDR3 memories. CACLM is based on the longest Manhattan distance due to the device placement. Verify the net class that satisfies this criteria and use as the baseline for CK/ADDR\_CTRL skew matching and length control.

The length of shorter CK/ADDR\_CTRL stubs as well as the length of the terminator stub are not included in this length calculation. Nonincluded lengths are grayed out in the figure.

Assuming A8 is the longest,  $CACLM = CACLMY + CACLMX + 300$  mils.  
The extra 300 mils allows for routing down lower than the DDR3 memories and returning up to reach A8.

**Figure 8-26. CACLM for Four Address Loads on One Side of PCB**

(1) Max value is based upon conservative signal integrity approach. This value could be extended only if detailed signal integrity analysis of rise time and fall time confirms desired operation.

(2) The use of vias should be minimized.

(3) Additional bypass capacitors are required when using the DDR\_1V5 plane as the reference plane to allow the return current to jump between the DDR\_1V5 plane and the ground plane when the net class switches layers at a via.

(4) Non-mirrored configuration (all DDR3 memories on same side of PCB).

(5) Mirrored configuration (one DDR3 device on top of the board and one DDR3 device on the bottom).

(6) While this length can be increased for convenience, its length should be minimized.

(7) ADDR\_CTRL net class only (not CK net class). Minimizing this skew is recommended, but not required.

(8) CK net class only.

(9) Center-to-center spacing is allowed to fall to minimum 2w for up to 1250 mils of routed length.

(10) The ADDR\_CTRL net class of the other DDR EMIF is considered *other DDR3 trace spacing*.

(11) CK spacing set to ensure proper differential impedance.

(12) The most important thing to do is control the impedance so inadvertent impedance mismatches are not created. Generally speaking, center-to-center spacing should be either 2w or slightly larger than 2w to achieve a differential impedance equal to twice the singleended impedance, Zo.

(13) Source termination (series resistor at driver) is specifically not allowed.

(14) Termination values should be uniform across the net class.

(15) Via count difference may increase by 1 only if accurate 3-D modeling of the signal flight times – including accurately modeled signal propagation through vias – has been applied to ensure all segment skew maximums are not exceeded.

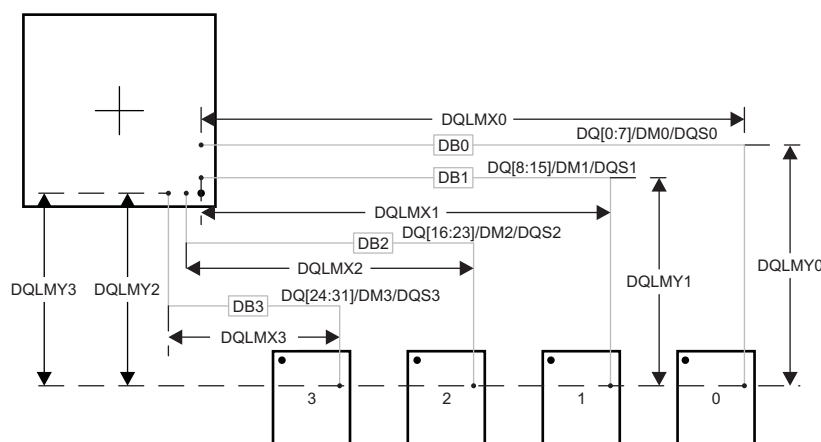

### 8.2.2.17.2 DQS and DQ Routing Specification

Skew within the DQS and DQ/DM net classes directly reduces setup and hold margin and thus this skew must be controlled. The only way to practically match lengths on a PCB is to lengthen the shorter traces up to the length of the longest net in the net class and its associated clock. As with CK and ADDR\_CTRL, a reasonable trace route length is to within a percentage of its Manhattan distance. DQLMn is defined as DQ Longest Manhattan distance n, where n is the byte number. For a 32-bit interface, there are four DQLMs, DQLM0-DQLM3. Likewise, for a 16-bit interface, there are two DQLMs, DQLM0-DQLM1.

#### NOTE

It is not required, nor is it recommended, to match the lengths across all bytes. Length matching is only required within each byte.

Given the DQS and DQ/DM pin locations on the processor and the DDR3 memories, the maximum possible Manhattan distance can be determined given the placement. Figure 8-28 shows this distance for four loads. It is from this distance that the specifications on the lengths of the transmission lines for the data bus are determined. For DQS and DQ/DM routing, these specifications are contained in Table 8-13.

DB0 - DB3 represent data bytes 0 - 3.

There are four DQLMs, one for each byte (32-bit interface). Each DQLM is the longest Manhattan distance of the byte; therefore:

$$\begin{aligned} \text{DQLM0} &= \text{DQLMX0} + \text{DQLMY0} \\ \text{DQLM1} &= \text{DQLMX1} + \text{DQLMY1} \\ \text{DQLM2} &= \text{DQLMX2} + \text{DQLMY2} \\ \text{DQLM3} &= \text{DQLMX3} + \text{DQLMY3} \end{aligned}$$

### 8.3 High Speed Differential Signal Routing Guidance

The *High-Speed Interface Layout Guidelines Application Report (SPRAAR7)* available from <http://www.ti.com/lit/pdf/spraar7> provides guidance for successful routing of the high speed differential signals. This includes PCB stackup and materials guidance as well as routing skew, length and spacing limits. TI supports *only* designs that follow the board design guidelines contained in the application report.

### 8.4 Power Distribution Network Implementation Guidance

The *Sitara Processor Power Distribution Networks: Implementation and Analysis (SPRAC76)* available from <http://www.ti.com/lit/pdf/sprac76> provides guidance for successful implementation of the power distribution network. This includes PCB stackup guidance as well as guidance for optimizing the selection and placement of the decoupling capacitors. TI supports *only* designs that follow the board design guidelines contained in the application report.

### 8.5 Thermal Solution Guidance

The *Thermal Design Guide for DSP and Arm Application Processors Application Report (SPRABI3)* available from <http://www.ti.com/lit/pdf/sprabi3> and the *AM572x Thermal Considerations Application Report (SPRAC53)* available from <http://www.ti.com/lit/pdf/sprac53> provide guidance for successful implementation of a thermal solution for system designs that contain an AM57xx application processor. They provide background information on common terms and methods related to thermal solutions. Test data and thermal calculations are also provided for a sample design. TI supports only designs that follow the system design guidelines contained in the application reports. Devices must be operated within their rated temperature ranges at all times to maintain proper function and rated Power On Hours.

### 8.6 Single-Ended Interfaces

#### 8.6.1 General Routing Guidelines

The following paragraphs detail the routing guidelines that must be observed when routing the various functional LVCMOS interfaces.

- Line spacing:
  - For a line width equal to  $W$ , the spacing between two lines must be  $2W$ , at least. This minimizes the crosstalk between switching signals between the different lines. On the PCB, this is not achievable everywhere (for example, when breaking signals out from the device package), but it is recommended to follow this rule as much as possible. When violating this guideline, minimize the length of the traces running parallel to each other (see [Figure 8-29](#)).

**Figure 8-29. Ground Guard Illustration**

- Length matching (unless otherwise specified):
  - For bus or traces at frequencies less than 10 MHz, the trace length matching (maximum length difference between the longest and the shortest lines) must be less than 25 mm.
  - For bus or traces at frequencies greater than 10 MHz, the trace length matching (maximum length difference between the longest and the shortest lines) must be less than 2.5 mm.
- Characteristic impedance
  - Unless otherwise specified, the characteristic impedance for single-ended interfaces is recommended to be between 35- $\Omega$  and 65- $\Omega$ .
- Multiple peripheral support
  - For interfaces where multiple peripherals have to be supported in the star topology, the length of each branch has to be balanced. Before closing the PCB design, it is highly recommended to verify signal integrity based on simulations including actual PCB extraction.

### 8.6.2 QSPI Board Design and Layout Guidelines

The following section details the routing guidelines that must be observed when routing the QSPI interfaces.

- The `qspi1_sclk` output signal must be looped back into the `qspi1_rtclk` input.
- The signal propagation delay from the `qspi1_sclk` ball to the QSPI device CLK input pin (A to C) must be approximately equal to the signal propagation delay from the QSPI device CLK pin to the `qspi1_rtclk` ball (C to D).
- The signal propagation delay from the QSPI device CLK pin to the `qspi1_rtclk` ball (C to D) must be approximately equal to the signal propagation delay of the control and data signals between the QSPI device and the SoC device (E to F, or F to E).
- The signal propagation delay from the `qspi1_sclk` signal to the series terminators ( $R2 = 10 \Omega$ ) near the QSPI device must be  $< 450\text{pS}$  ( $\sim 7\text{cm}$  as stripline or  $\sim 8\text{cm}$  as microstrip)
- 50  $\Omega$  PCB routing is recommended along with series terminations, as shown in [Figure 8-30](#).
- Propagation delays and matching:
  - A to C = C to D = E to F.
  - Matching skew:  $< 60\text{pS}$
  - A to B  $< 450\text{pS}$
  - B to C = as small as possible ( $< 60\text{pS}$ )

**Figure 8-30. QSPI Interface High Level Schematic**

(1) 0 Ω resistor (R1), located as close as possible to the qspi1\_sclk pin, is placeholder for fine-tuning if needed.

## 8.7 LJCB\_REFN/P Connections

A Common Refclk Rx Architecture is required to be used for the device PCIe interface. Specifically, two modes of Common Refclk Rx Architecture are supported:

- **External REFCLK Mode:** An common external 100MHz clock source is distributed to both the Device and the link partner
- **Output REFCLK Mode:** A 100MHz HCSL clock source is output by the device and used by the link partner

In **External REFCLK Mode**, a high-quality, low-jitter, differential HCSL 100MHz clock source compliant to the PCIe REFCLK AC Specifications should be provided on the Device's ljcb\_clkn / ljcb\_clkp inputs.

Alternatively, an LVDS clock source can be used with the following additional requirements:

- External AC coupling capacitors described in [Table 8-14](#) should be populated at the ljcb\_clkn / ljcb\_clkp inputs.
- All termination requirements (ex. parallel 100ohm termination) from the clock source manufacturer should be followed.

In **Output REFCLK Mode**, the 100MHz clock from the Device's DPLL\_PCIE\_REF should be output on the Device's ljcb\_clkn / ljcb\_clkp pins and used as the HCSL REFCLK by the link partner. External near-side termination to ground described in [Table 8-15](#) is required on both of the ljcb\_clkn / ljcb\_clkp outputs in this mode.

**Table 8-14. LJCB\_REFN/P Requirements in External LVDS REFCLK Mode**

| PARAMETER   | MIN | TYP | MAX | UNIT |
|---|-----|-----|-----|------|
| ljcb_clkn / ljcb_clkp AC coupling capacitor value |     | 100 |     | nF   |

**Table 8-14. LJCB\_REFN/P Requirements in External LVDS REFCLK Mode (continued)**

| PARAMETER  | MIN | TYP  | MAX  | UNIT                  |
|--|-----|------|------|-----------------------|
| ljcb_clkn / ljcb_clkp AC coupling capacitor package size |     | 0402 | 0603 | EIA <sup>(1)(2)</sup> |

(1) EIA LxW units, that is, a 0402 is a 40x20 mils surface mount capacitor.

(2) The physical size of the capacitor should be as small as practical. Use the same size on both lines in each pair placed side by side.

**Table 8-15. LJCB\_REFN/P Requirements in Output REFCLK Mode**

| PARAMETER   | MIN  | TYP | MAX  | UNIT |
|---|------|-----|------|------|
| ljcb_clkn / ljcb_clkp near-side termination to ground value | 47.5 | 50  | 52.5 | Ohms |

## 8.8 Clock Routing Guidelines

### 8.8.1 32-kHz Oscillator Routing

When designing the printed-circuit board:

- Keep the crystal as close as possible to the crystal pins X1 and X2.
- Keep the trace lengths short and small to reduce capacitor loading and prevent unwanted noise pickup.
- Place a guard ring around the crystal and tie the ring to ground to help isolate the crystal from unwanted noise pickup.
- Keep all signals out from beneath the crystal and the X1 and X2 pins to prevent noise coupling.
- Finally, an additional local ground plane on an adjacent PCB layer can be added under the crystal to shield it from unwanted pickup from traces on other layers of the board. This plane must be isolated from the regular PCB ground plane and tied to the GND pin of the RTC. The plane must not be any larger than the perimeter of the guard ring. Make sure that this ground plane does not contribute to significant capacitance (a few pF) between the signal line and ground on the connections that run from X1 and X2 to the crystal.

**Figure 8-31. Slow Clock PCB Requirements**

### 8.8.2 Oscillator Ground Connection

Although the impedance of a ground plane is low it is, of course, not zero. Therefore, any noise current in the ground plane causes a voltage drop in the ground. Figure 8-32 shows the grounding scheme for slow (low frequency) clock generated from the internal oscillator.

**Figure 8-32. Grounding Scheme for Low-Frequency Clock**

Figure 8-33 shows the grounding scheme for high-frequency clock.

## 9 Device and Documentation Support

TI offers an extensive line of development tools, including methods to evaluate the performance of the processors, generate code, develop algorithm implementations, and fully integrate and debug software and hardware modules as listed below.

### 9.1 Device Nomenclature

To designate the stages in the product development cycle, TI assigns prefixes to the part numbers of all microprocessors (MPUs) and support tools. Each device has one of three prefixes: X, P, or null (no prefix) (for example, AM572x). Texas Instruments recommends two of three possible prefix designators for its support tools: TMDX and TMDS. These prefixes represent evolutionary stages of product development from engineering prototypes (TMDX) through fully qualified production devices and tools (TMDS).

Device development evolutionary flow:

- X** Experimental device that is not necessarily representative of the final device's electrical specifications and may not use production assembly flow.
- P** Prototype device that is not necessarily the final silicon die and may not necessarily meet final electrical specifications.
- null** Production version of the silicon die that is fully qualified.

Support tool development evolutionary flow:

- TMDX** Development-support product that has not yet completed Texas Instruments internal qualification testing.
- TMDS** Fully-qualified development-support product.

X and P devices and TMDX development-support tools are shipped against the following disclaimer:

"Developmental product is intended for internal evaluation purposes."

Production devices and TMDS development-support tools have been characterized fully, and the quality and reliability of the device have been demonstrated fully. TI's standard warranty applies.

Predictions show that prototype devices (X or P) have a greater failure rate than the standard production devices. Texas Instruments recommends that these devices not be used in any production system because their expected end-use failure rate still is undefined. Only qualified production devices are to be used.

For orderable part numbers of AM572x devices in the ABC package type, see the Package Option Addendum of this document, the TI website ([ti.com](http://ti.com)), or contact your TI sales representative.

For additional description of the device nomenclature markings on the die, see the Silicon Errata (literature number SPRZ429).

#### 9.1.1 Standard Package Symbolization

---

#### NOTE

Some devices may have a cosmetic circular marking visible on the top of the device package which results from the production test process. In addition, some devices may also show a color variation in the package substrate which results from the substrate manufacturer. These differences are cosmetic only with no reliability impact.

## 9.2 Tools and Software

The following products support development for AM572x platforms:

### Design Kits and Evaluation Modules

#### AM572x Evaluation Module

The AM572x Evaluation Module provides an affordable platform to quickly start evaluation of Sitara™ Arm® Cortex®-A15 AM57x Processors (AM5728, AM5726, AM5718, AM5716) and accelerate development for HMI, machine vision, networking, medical imaging and many other industrial applications. It is a development platform based on the dual Arm® Cortex®-A15, dual C66x DSP processor that is integrated with tons of connectivity such as PCIe, SATA, HDMI, USB 3.0/2.0, Dual Gigabit Ethernet, and more. The AM572x Evaluation Module also integrates video and 3D/2D graphics acceleration, as well as a dual-core Programmable Real-time Unit (PRU) and dual Arm® Cortex®-M4 cores.

#### AM572x Industrial Development Kit (IDK)

The AM572x Industrial Development Kit (IDK) is a development platform for evaluating the industrial communication and control capabilities of Sitara AM572x processors for applications in factory automation, drives, robotics, grid infrastructure, and more. AM572x processors include dual PRU-ICSS (Programmable Real-time Unit for Industrial Communications) sub-systems which can be used for industrial Ethernet protocols such as Profinet, EtherCAT, Ethernet/IP, and others. The [TMDXIDK5728](#) breaks out six ports of Ethernet, four of which can be used concurrently: 2x Gb Ethernet ports and 2x 10/100 Ethernet ports from the PRU-ICSS subsystems.

### Development Tools

#### Code Composer Studio (CCS) Integrated Development Environment (IDE)

Code Composer Studio is an integrated development environment (IDE) that supports TI's Microcontroller and Embedded Processors portfolio. Code Composer Studio comprises a suite of tools used to develop and debug embedded applications. It includes an optimizing C/C++ compiler, source code editor, project build environment, debugger, profiler, and many other features. The intuitive IDE provides a single user interface taking you through each step of the application development flow. Familiar tools and interfaces allow users to get started faster than ever before. Code Composer Studio combines the advantages of the Eclipse software framework with advanced embedded debug capabilities from TI resulting in a compelling feature-rich development environment for embedded developers.

#### Pin mux tool

The Pin MUX Utility is a software tool which provides a Graphical User Interface for configuring pin multiplexing settings, resolving conflicts and specifying I/O cell characteristics for TI MPUs. Results are output as C header/code files that can be imported into software development kits (SDKs) or used to configure customer's custom software. Version 4 of the Pin Mux utility adds the capability of automatically selecting a mux configuration that satisfies the entered requirements.

#### Power Estimation Tool (PET)

Power Estimation Tool (PET) provides users the ability to gain insight in to the power consumption of select TI processors. The tool includes the ability for the user to choose multiple application scenarios and understand the power consumption as well as how advanced power saving techniques can be applied to further reduce overall power consumption.

### Models

**AM572x IBIS Model** IBIS Model

**AM572x 23 mm Thermal Models** Thermal Model

For a complete listing of development-support tools for the processor platform, visit the Texas Instruments website at [ti.com](http://ti.com). For information on pricing and availability, contact the nearest TI field sales office or authorized distributor.

### 9.3 Documentation Support

To receive notification of documentation updates, navigate to the device product folder on [ti.com](http://ti.com). In the upper right corner, click on *Alert me* to register and receive a weekly digest of any product information that has changed. For change details, review the revision history included in any revised document.

The following documents describe the AM572x devices.

#### Technical Reference Manual

##### **AM572x Sitara™ Processors Silicon Revision 2.0, 1.1**

Details the integration, the environment, the functional description, and the programming models for each peripheral and subsystem in the AM572x family of devices.

#### Errata

##### **AM572x Sitara™ Processors Silicon Revision 2.0, 1.1**

Describes the known exceptions to the functional specifications for the device.

## 9.7 Electrostatic Discharge Caution

This integrated circuit can be damaged by ESD. Texas Instruments recommends that all integrated circuits be handled with appropriate precautions. Failure to observe proper handling and installation procedures can cause damage.

ESD damage can range from subtle performance degradation to complete device failure. Precision integrated circuits may be more susceptible to damage because very small parametric changes could cause the device not to meet its published specifications.

(1) The marketing status values are defined as follows:

**ACTIVE:** Product device recommended for new designs.

**LIFEBUY:** TI has announced that the device will be discontinued, and a lifetime-buy period is in effect.

**NRND:** Not recommended for new designs. Device is in production to support existing customers, but TI does not recommend using this part in a new design.

**PREVIEW:** Device has been announced but is not in production. Samples may or may not be available.

**OBSOLETE:** TI has discontinued the production of the device.

(2) **RoHS:** TI defines "RoHS" to mean semiconductor products that are compliant with the current EU RoHS requirements for all 10 RoHS substances, including the requirement that RoHS substance do not exceed 0.1% by weight in homogeneous materials. Where designed to be soldered at high temperatures, "RoHS" products are suitable for use in specified lead-free processes. TI may reference these types of products as "Pb-Free".

**RoHS Exempt:** TI defines "RoHS Exempt" to mean products that contain lead but are compliant with EU RoHS pursuant to a specific EU RoHS exemption.

**Green:** TI defines "Green" to mean the content of Chlorine (Cl) and Bromine (Br) based flame retardants meet JS709B low halogen requirements of <=1000ppm threshold. Antimony trioxide based flame retardants must also meet the <=1000ppm threshold requirement.

(3) MSL, Peak Temp. - The Moisture Sensitivity Level rating according to the JEDEC industry standard classifications, and peak solder temperature.

(4) There may be additional marking, which relates to the logo, the lot trace code information, or the environmental category on the device.

(5) Multiple Device Markings will be inside parentheses. Only one Device Marking contained in parentheses and separated by a "~" will appear on a device. If a line is indented then it is a continuation of the previous line and the two combined represent the entire Device Marking for that device.

(6) Lead finish/Ball material - Orderable Devices may have multiple material finish options. Finish options are separated by a vertical ruled line. Lead finish/Ball material values may wrap to two lines if the finish value exceeds the maximum column width.

**Important Information and Disclaimer:** The information provided on this page represents TI's knowledge and belief as of the date that it is provided. TI bases its knowledge and belief on information provided by third parties, and makes no representation or warranty as to the accuracy of such information. Efforts are underway to better integrate information from third parties. TI has taken and continues to take reasonable steps to provide representative and accurate information but may not have conducted destructive testing or chemical analysis on incoming materials and chemicals. TI and TI suppliers consider certain information to be proprietary, and thus CAS numbers and other limited information may not be available for release.

In no event shall TI's liability arising out of such information exceed the total purchase price of the TI part(s) at issue in this document sold by TI to Customer on an annual basis.
