

DS250DF230 25-Gbps Multi-Rate 2-Channel Retimer

1 Features

- Dual-channel multi-rate retimer with integrated signal conditioning
- All channels lock independently from 19.6 to 25.8 Gbps (including sub-rates, such as 12.16512 Gbps, 9.8304 Gbps, 6.144 Gbps, and more)
- Ultra-low latency: <500 ps Typical for 25.78125-Gbps data rate
- Adaptive continuous time linear equalizer (CTLE)
- Continuous adaptive decision feedback equalizer (DFE), capable of compensating large channel loss variation over temperature
- Combined equalization supporting 35-dB channel loss at 12.9 GHz
- On-chip eye-opening monitor (EOM), PRBS pattern checker and generator
- Low-jitter transmitter with 3-Tap FIR filter
- Integrated 2×2 cross-point
- Recovered clock available for system clock synchronization applications on channel 0
- Single power supply, no low-jitter reference clock required
- Wide stay-in-lock temperature range

2 Applications

- Jitter cleaning for front-port optical interface in wireless and wired systems
- Backplane/mid-plane reach extension
- Active cable assemblies
- 802.3bj 100GbE, InfiniBand EDR, and OIF-CEI-25G-LR/MR/SR/VSR electrical interfaces
- SFP28, QSFP28, CFP2/CFP4, CDFP

3 Description

The DS250DF230 is a dual-channel multi-rate retimer with integrated signal conditioning. The device is used to extend the reach and robustness of long, lossy, crosstalk-impaired high-speed serial links and while achieving a bit error rate (BER) of 10^{-15} or less.

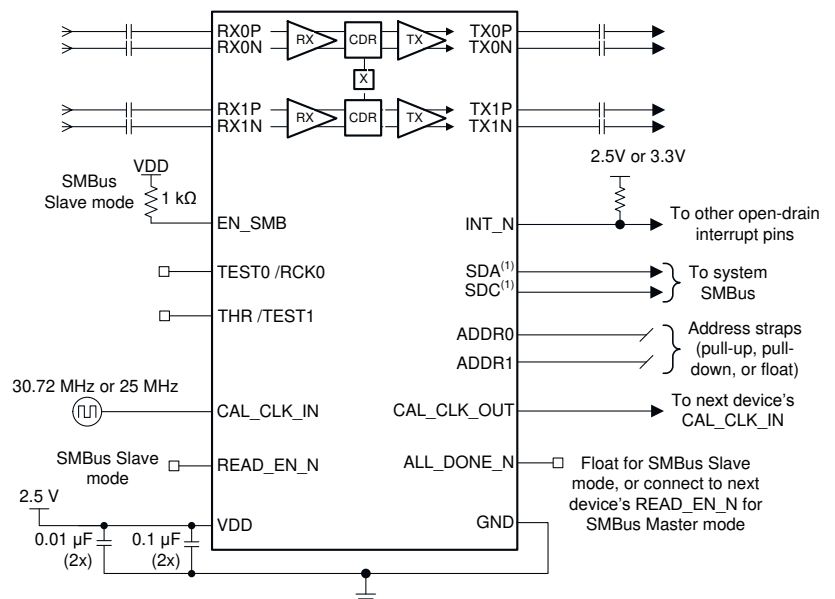

Each channel of the DS250DF230 independently locks to serial data rates in a continuous range from 19.6 Gbps to 25.8 Gbps or to any supported sub-rate ($\div 2$ and $\div 4$), including key data rates such as 12.16512 Gbps, 9.8304 Gbps, and 6.144 Gbps.

The DS250DF230 is offered in two package options, 36-pin NFBGA and 32-pin QFN, with compact body sizes of 5×5 mm. The NFBGA (ZLS) package offers robust performance and ease of design with minimal BOM footprint, while the QFN (RTV) package offers similar performance characteristics with improved thermal performance supporting PCB temperatures up to 105°C without the need for a heat sink.

Device Information⁽¹⁾

PART NUMBER	PACKAGE	BODY SIZE (NOM)
DS250DF230ZLS	NFBGA (36)	5.00 mm × 5.00 mm
DS250DF230RTV	QFN (32)	5.00 mm × 5.00 mm

- (1) For all available packages, see the orderable addendum at the end of the data sheet.

- (1) SMBus signals need to be pulled up elsewhere in the system.

4 Revision History

NOTE: Page numbers for previous revisions may differ from page numbers in the current version.

Changes from Revision B (October 2019) to Revision C (June 2021)	Page
• Updated the numbering format for tables, figures, and cross-references throughout the document.....	1
• Added QFN (RTV) package option information.....	1
• Added QFN (RTV) pin configuration and functions.....	4
• Added QFN (RTV) thermal information.....	8
• Added t_{EQ_Adapt} typical value.....	8
• Added footnotes about bit errors during EQ adaptation and difference in t_{EQ_ADAPT} for lower line rates.....	8
• Added Fast CDR Lock Mode section to Detailed Description	19
• Added CDR Status Description to Channel Reg 0x02.....	32

Changes from Revision A (December 2018) to Revision B (October 2019)	Page
• Initial Public Release.....	1
• Changed Channel Reg_0x79[4] definition, marking this as RESERVED.....	32
• Changed Channel Reg_0x7E[3:0] definition, marking this as RESERVED.....	32
• Changed Channel Reg_0x7F[5] definition, marking this as RESERVED.....	32
• Changed Channel Reg_0x8C definition, marking this register as RESERVED.....	32
• Added expanded Channel Reg_0x95 definition.....	32

5 Description (continued)

The DS250DF230 has a single power supply and minimal need for external components. These features reduce PCB routing complexity and BOM cost.

The advanced equalization features of the DS250DF230 include a low-jitter 3-tap transmit finite impulse response (FIR) filter, an adaptive continuous-time linear equalizer (CTLE), and an adaptive decision feedback equalizer (DFE). This enables reach extension for lossy interconnect and backplanes with multiple connectors and crosstalk. The integrated CDR function is available for front-port optical module applications to reset the jitter budget and retime the high-speed serial data. The DS250DF230 supplies 2x2 cross-point that gives the host lane crossing, fanout, and multiplexing options.

The DS250DF230 can be configured either through the SMBus or through an external EEPROM. Up to 16 devices can share an EEPROM using common-channel configuration. A non-disruptive on-chip eye monitor and a PRBS generator and checker is available for in-system diagnostics.

6 Pin Configuration and Functions

Figure 6-1. ZLS Package 36-Pin NFBGA Top View

Figure 6-2. RTV Package 32-Pin QFN Top View

Table 6-1. Pin Functions

NAME	PIN		TYPE	INTERNAL PULL-UP/ PULL-DOWN	DESCRIPTION
	NFBGA	QFN			
HIGH-SPEED DIFFERENTIAL I/Os					
RX0P	A6	18	Input	None	Inverting and noninverting differential inputs to the equalizer. An on-chip, 100-Ω termination resistor connects RXP to RXN. These inputs must be AC-coupled.
RX0N	A5	19	Input	None	
RX1P	A2	22	Input	None	Inverting and noninverting differential inputs to the equalizer. An on-chip, 100-Ω termination resistor connects RXP to RXN. These inputs must be AC-coupled.
RX1N	A1	23	Input	None	
TX0P	F6	7	Output	None	Inverting and noninverting 50Ω driver outputs. These outputs must be AC-coupled.
TX0N	F5	6	Output	None	
TX1P	F2	3	Output	None	Inverting and noninverting 50Ω driver outputs. These outputs must be AC-coupled.
TX1N	F1	2	Output	None	
CALIBRATION CLOCK PINS					
CAL_CLK_IN	D6	10	Input, 2.5V LVCMOS	None	30.72-MHz (±100 PPM), 2.5-V single-ended clock from external oscillator. No stringent phase noise or jitter requirements on this clock. Also supports 25-MHz (±100 PPM) clock by programming the corresponding registers.
CAL_CLK_OUT	D1	31	Output, 2.5V LVCMOS	None	2.5-V buffered replica of calibration clock input (CAL_CLK_IN) for connecting multiple (up to 20 or more) devices in a daisy-chained fashion.
SYSTEM MANAGEMENT BUS (SMBus) PINS					
ADDR0	C1	25	Input, 4-level	None	4-level strap pins used to set the SMBus address of the device. The pin state is read on power-up. The multi-level nature of these pins allows for 16 unique device addresses. The four strap options include: 0: 1 kΩ to GND R: 10 kΩ to GND F: Float 1: 1 kΩ to VDD Refer to Section 8.4.3 for more information.
ADDR1	B4	16	Input, 4-level	None	

Table 6-1. Pin Functions (continued)

NAME	PIN		TYPE	INTERNAL PULL-UP/ PULL-DOWN	DESCRIPTION
	NFBGA	QFN			
EN_SMB	C6	15	Input, 4-level	None	Four-level, 2.5-V input used to select between SMBus master mode (float) and SMBus slave mode (high). The three defined levels are: R: 10 kΩ to GND - RESERVED, TI test mode F: Float - SMBus Master Mode (2.5-V/3.3-V SMBUS interface only) 1: 1 kΩ to VDD - SMBus Slave Mode
THR /TEST1	D5	12	Input, 4-level	None	Select the electrical voltage of SMBus interface. 2.5-V/3.3-V or 1.8-V: 1: 1 kΩ to VDD - 1.8-V SMBus interface F: Float - 1.8-V SMBus interface 0: 1 kΩ to GND - 2.5-V/3.3-V SMBus interface In TI test mode (EN_SMB = 10k Ohm to GND), this is reserved TI test pin.
SDA	D2	29	I/O, Open Drain	None	SMBus data input / open-drain output. External 2-kΩ to 5-kΩ pullup resistor is required as per SMBus interface standard. This pin is 3.3-V tolerant.
SDC	C2	28	I/O, Open Drain	None	SMBus clock input / open-drain clock output. External 2-kΩ to 5-kΩ pullup resistor is required as per SMBus interface standard. This pin is 3.3-V tolerant.
SMBus MASTER MODE PINS					
ALL_DONE_N	E3	32	Output, 2.5-V LVC MOS	None	Indicates the completion of a valid EEPROM register load operation when in SMBus Master Mode (EN_SMB=Float): High = External EEPROM load failed or incomplete Low = External EEPROM load successful and complete When in SMBus slave mode (EN_SMB=1), this output reflects the status of the READ_EN_N input.
READ_EN_N	E4	9	Input, 3.3-V LVC MOS	Weak pullup to VDD	SMBus Master Mode (EN_SMB=Float): When asserted low, initiates the SMBus master mode EEPROM read function. Once EEPROM read is complete (indicated by assertion of ALL_DONE_N low), this pin can be held low for normal device operation. SMBus Slave Mode (EN_SMB=1): When asserted low, this causes the device to be held in reset (SMBus state machine reset and register reset). This pin must be pulled high or left floating for normal operation in SMBus Slave Mode. This pin is 3.3-V tolerant.
MISCELLANEOUS PINS					
INT_N	B3	26	Output, Open-Drain	None	Open-drain, 3.3-V tolerant active-low interrupt output. It pulls low when an interrupt occurs. The events which trigger an interrupt are programmable through SMBus registers. This pin can be connected in a wired-OR fashion with other device's interrupt pin. A single pullup resistor in the 2-kΩ to 5-kΩ range is adequate for the entire INT_N net.
TEST0 /RCK0	C5	13	I/O, 2.5-V LVC MOS	None	In TI test mode (EN_SMB = 10k Ohm to GND), this is reserved TI test pin. During normal (non-test-mode) operation, this pin is configured as input by default and therefore is not affected by the presence of a signal. This pin may be left floating, tied to GND, or connected to a 2.5-V (max) output. This pin can be configured to offer the recovered clock for CH0 by programming the corresponding registers. The signal is 2.5-V LVC MOS.
POWER					
VDD	C3, C4, D3, D4	11, 14, 27, 30	Power	None	Power supply, VDD = 2.5 V ±5%. TI recommends connecting at least four de-coupling capacitors between the Retimer VDD plane and GND as close to the Retimer as possible. For example, two 0.1-μF capacitors, and two 0.01-μF capacitors directly beneath the device or as close to the VDD pins as possible. The VDD pins on this device must be connected through a low-resistance path to the board VDD plane.

Table 6-1. Pin Functions (continued)

NAME	PIN		TYPE	INTERNAL PULL-UP/ PULL- DOWN	DESCRIPTION
	NFBGA	QFN			
GND	A3, A4,B1, B2,B5, B6,E1, E2,E5, E6,F3, F4	1, 4, 5, 8, 17, 20, 21, 24	Power	None	Ground reference. The GND pins on this device must be connected through a low-resistance path to the board GND plane.
DAP	—	DAP	Power	None	DAP is the exposed pad at the bottom of the RTV package. The exposed pad should be connected to the GND plane through a 3x3 via array.

7 Specifications

7.1 Absolute Maximum Ratings

over operating free-air temperature range (unless otherwise noted)⁽¹⁾

		MIN	MAX	UNIT
VDD_ABSMAX	Supply Voltage, VDD to GND	-0.5	2.75	V
VIO_2.5V-ABSMAX	2.5V I/O voltage (LVCMOS and Analog)	-0.5	2.75	V
VIO_3.3V-ABSMAX	3.3V I/O Voltage (SDA, SDC, INT_N, READ_EN)	-0.5	4	V
VIN_ABSMAX	Signal Input voltage(RXnP, RXnN)	-0.5	2.75	V
VOUT_ABSMAX	Signal Output voltage(TXnP, TXnN)	-0.5	2.75	V
TJ_ABSMAX	Junction Temperature		150	°C
T_stg	Storage Temperature range	-40	150	°C

- (1) Stresses beyond those listed under *Absolute Maximum Rating* may cause permanent damage to the device. These are stress ratings only, which do not imply functional operation of the device at these or any other conditions beyond those indicated under *Recommended Operating Condition*. Exposure to absolute-maximum-rated conditions for extended periods may affect device reliability.

7.2 ESD Ratings

			VALUE	UNIT
V _(ESD)	Electrostatic discharge	Human body model (HBM), per ANSI/ESDA/JEDEC JS-001, all pins ⁽¹⁾	±2000	V
		Charged device model (CDM), per JEDEC specification JESD22-C101, all pins ⁽²⁾	±1000	

- (1) JEDEC document JEP155 states that 500-V HBM allows safe manufacturing with a standard ESD control process.
(2) JEDEC document JEP157 states that 250-V CDM allows safe manufacturing with a standard ESD control process.

7.3 Recommended Operating Conditions

over operating free-air temperature range (unless otherwise noted)

		MIN	NOM	MAX	UNIT
VDD	Supply voltage, VDD to GND. DC plus AC power should not exceed these limits.	2.375	2.5	2.625	V
N _{VDD}	Supply noise, DC to <50 Hz, sinusoidal ⁽¹⁾			250	mVpp
N _{VDD}	Supply noise, 50 Hz to 10 MHz, sinusoidal ⁽¹⁾			20	mVpp
N _{VDD}	Supply noise, >10 MHz, sinusoidal ⁽¹⁾			10	mVpp
T _{ramp}	VDD supply ramp time, from 0 V to 2.375 V	150			us
T _J	Operating junction temperature	-40		110	°C
T _A	Operating ambient temperature	-40		85 ⁽²⁾	°C
VIO_2.5V	2.5 V LVCMOS	2.375	2.5	2.625	V
VIO_3.3V_INT_N	Open Drain I/O voltage(INT_N)			3.6	V
VIO_3.3V	Open Drain I/O voltage(SDA, SDC) ⁽³⁾			3.6	V

- (1) Steps must be taken to ensure the combined AC plus DC noise meets the VDD supply voltage limits.
(2) Steps must be taken to ensure the operating junction temperature range and stay-in-lock range (TEMP_{LOCK+}, TEMP_{LOCK-}) are met. Refer to the [Electrical Characteristics](#) for more details concerning TEMP_{LOCK+} and TEMP_{LOCK-}.
(3) Set THR pin to select SMBUS electrical voltage

7.4 Thermal Information

THERMAL METRIC ⁽¹⁾		CONDITIONS ⁽²⁾	DS250DF230ZLS	DS250DF230RTV	UNIT
			ZLS (NFBGA)	RTV (QFN)	
			36 PINS	32 PINS	
$R_{\theta JA}$	Junction-to-ambient thermal resistance	4-layer JEDEC board	49.3	30.3	°C/W
$R_{\theta JC(top)}$	Junction-to-case (top) thermal resistance	4-layer JEDEC board	20.7	17.6	°C/W
$R_{\theta JB}$	Junction-to-board thermal resistance	4-layer JEDEC board	24.5	10.7	°C/W
Ψ_{JT}	Junction-to-top characterization parameter	4-layer JEDEC board	0.5	0.2	°C/W
Ψ_{JB}	Junction-to-board characterization parameter	4-layer JEDEC board	24.7	10.6	°C/W
$R_{\theta JC(bot)}$	Junction-to-case (bot) thermal resistance	4-layer JEDEC board	--	1.8	°C/W

- (1) For more information about traditional and new thermal metrics, see the [Semiconductor and IC Package Thermal Metrics](#) application report.
- (2) No heat sink or airflow was assumed for these estimations. Depending on the application, a heat sink, faster airflow, and/or reduced ambient temperature (<85 C) may be required in order to meet the maximum junction temperature specification per the Recommended Operating Conditions.

7.5 Electrical Characteristics

over operating free-air temperature range (unless otherwise noted)

PARAMETER		TEST CONDITIONS	MIN	TYP	MAX	UNIT
POWER CONSUMPTION						
$W_{Channel}$	Power Consumption Per Active Channel	Active mode with CTLE, Tx FIR, full DFE and Crosspoint enabled. Idle power consumption not included.		256	347	mW
		Active mode with CTLE, Tx FIR, and full DFE enabled. Crosspoint disabled. Idle power consumption not included.		248		mW
		Active mode with CTLE, Tx FIR, and partial DFE enabled(taps 1-2 only). Crosspoint and DFE taps 3-5 disabled. Idle power consumption not included.		235		mW
		Active mode with CTLE, and Tx FIR enabled. DFE and crosspoint disabled. Idle power consumption not included.		226		mW
		Assuming CDR acquiring lock with CTLE, full DFE, Tx FIR, Driver, and Crosspoint enabled. Idle power consumption not included.		380	445	mW
		Assuming CDR acquiring lock with CTLE, full DFE, Tx FIR, Driver, and Crosspoint disabled. Idle power consumption not included.		333		mW
W_{PRBS}	PRBS Checker Power Consumption only Per Channel			200		mW
	PRBS Generator Power Consumption only Per Channel			190		mW
W_{Static_Total}	Total Idle Power Consumption	Idle/Static mode. Power supplied, no high-speed data present at inputs, channel automatically powered down.		165		mW
I_{Static_Total}	Idle mode total device supply current consumption	Idle/Static mode. Power supplied, no high-speed data present at inputs, channel automatically powered down.		66	100	mA

7.5 Electrical Characteristics (continued)

over operating free-air temperature range (unless otherwise noted)

PARAMETER		TEST CONDITIONS	MIN	TYP	MAX	UNIT
I _{Total}	Active Mode Total Device Supply Current Consumption	Active mode with CTLE, Tx FIR, full DFE and Crosspoint enabled.		271	361	mA
		Active mode with CTLE, Tx FIR, and full DFE enabled. Crosspoint disabled.		265		mA
		Active mode with CTLE, Tx FIR, and partial DFE enabled(taps 1-2 only). Crosspoint and DFE taps 3-5 disabled.		255		mA
		Active mode with CTLE, and Tx FIR enabled. DFE and crosspoint disabled.		247		mA
GENERAL DEVICE-LEVEL SPECIFICATIONS						
R _{baud}	Supported input data rate	Full-rate (divide-by-1) mode of operation.	19.6		25.8	Gbps
		Half-rate (divide-by-2) mode of operation.	9.8		12.9	Gbps
		Quarter-rate (divide-by-4) mode of operation.	4.9		6.45	Gbps
t _{EEPROM}	EEPROM configuration load time	Single device reading its configuration from an EEPROM. Common channel configuration. This time scales with the number of devices reading from the same EEPROM.			15 ⁽¹⁾	ms
	EEPROM configuration load time	Single device reading its configuration from an EEPROM. Unique-channel configuration. This time scales with the number of devices reading from the same EEPROM.			40 ⁽¹⁾	ms
t _{POR}	Power-on reset assertion-time	Internal power-on reset (PoR) stretch between stable power supply and de-assertion of internal PoR. The SMBus address is latched on the completion of the PoR stretch, and SMBus accesses are permitted.			50	ms
HIGH-SPEED DIFFERENTIAL OUTPUTS (TXnP, TXnN)						
V _{OD}	Output differential voltage amplitude	Measured with c(0)=4 setting (REG_0x3D[6:0]=0x04, REG_0x3E[6:0]=0x40, REG_0x3F[6:0]=0x40). Differential measurement using an 8T pattern (eight 1s followed by eight 0s) at 25.78125 Gbps with TXPn and TXNn terminated by 50 Ohms to GND.		392		mVppd
	Output differential voltage amplitude	Measured with c(0)=31 setting (REG_0x3D[6:0]=0x1F, REG_0x3E[6:0]=0x40, REG_0x3F[6:0]=0x40). Differential measurement using an 8T pattern (eight 1s followed by eight 0s) at 25.78125 Gbps with TXPn and TXNn terminated by 50 Ohms to GND.		1195		mVppd
V _{OD_Raw_L}	Output differential voltage amplitude under Raw Mode, low swing setting	Raw Mode(CDR Bypassed), low swing setting(REG_0xD[0]=0), differential measurement using 8T pattern(eight 1s followed by eight 0s) at 25.78125Gbps and 9.8304Gbps with TXPn and TXNn terminated by 50 Ohms to GND. RPH=REG_0x1A[7:6]=0		602		mVppd

7.5 Electrical Characteristics (continued)

over operating free-air temperature range (unless otherwise noted)

PARAMETER		TEST CONDITIONS	MIN	TYP	MAX	UNIT
$V_{OD_Raw_H}$	Output differential voltage amplitude under Raw Mode, high swing setting	Raw Mode(CDR Bypassed), high swing setting(REG_0xD[0]=1), differential measurement using 8T pattern(eight 1s followed by eight 0s) at 25.78125Gbps and 9.8304Gbps with TXPn and TXNn terminated by 50 Ohms to GND. RPH=REG_0x1A[7:6]=0x3		919		mVppd
V_{OD_Idle}	Differential output amplitude with TX disabled			6.1		mVppd
V_{cm_TX}	DC common-mode output voltage	With respect to signal ground. Measured using an 8T pattern (eight 1s followed by eight 0s) at 25.78125 Gbps with TXPn and TXNn terminated by 50 Ohms to GND. Measured for c(-1)=c(1)=0 and VOD settings in the range of 600 mVppd to 1200 mVppd.		1.01		V
$V_{cm_TX_AC}$	Common-mode AC output noise	With respect to signal ground. Measured with PRBS9 data pattern. Measured with a 33GHz (-3dB) low-pass filter.		7.4		mV, RMS
t_r, t_f	Output transition-time	20%-to-80% rise time and 80%-to-20% fall time on a clock-like {11111 00000} data pattern at 25.78125 Gbps. Measured for ~750 mVppd output amplitude and no equalization: REG_0x3D=+13, REG_0x3E=0, REG_0x3F=0		17.5		ps
	Output transition-time, Low slew rate setting	Slow slew rate setting(REG_0x3D[5]=1), 20%-to-80% rise time and 80%-to-20% fall time on a clock-like {11111 00000} data pattern at 9.8304 Gbps. Measured for ~750 mVppd output amplitude and no equalization: REG_0x3D=+13, REG_0x3E=0, REG_0x3F=0		24		ps
RL_{SDD22}	Differential output return loss, SDD22 ⁽²⁾	Between 50 MHz and 5 GHz		-15.9		dB
	Differential output return loss, SDD22 ⁽²⁾	Between 5 GHz and 12.9 GHz		-13		dB
RL_{SCD22}	Differential to common-mode output return loss, SCD22 ⁽²⁾	Between 50 MHz and 12.9 GHz		-24		dB
RL_{SDC22}	Common-mode to differential output return loss, SDC22 ⁽²⁾	Between 50 MHz and 12.9 GHz		-24		dB
RL_{SCC22}	Common-mode output return loss, SCC22 ⁽²⁾	Between 50 MHz and 10 GHz		-8		dB
	Common-mode output return loss, SCC22 ⁽²⁾	Between 10 GHz and 12.9 GHz		-8.5		dB
RETIMER TIMING SPECIFICATIONS						
t_D	Input-to-output latency (propagation delay) through a channel	No Crosspoint; CDR enabled and locked.		4.5 UI + 175 ps		ps
		Crosspoint enabled; CDR enabled and locked.		4.5 UI + 220 ps		ps
		No crosspoint; CDR in raw mode.		140		ps
t_{D_V}	Variation of Input-to-output latency	Crosspoint enabled; CDR enabled and locked.		± 50		ps
t_{SK}	Channel-to-channel interpair skew	Latency difference between channels at full-rate.		30		ps

7.5 Electrical Characteristics (continued)

over operating free-air temperature range (unless otherwise noted)

PARAMETER		TEST CONDITIONS	MIN	TYP	MAX	UNIT
t _{Lock}	CDR lock acquisition-time, Normal Lock Mode	Measured at 25.78125 Gbps, Adapt mode 2 (REG_0x31[6:5]=0x2)		<100		ms
	CDR lock acquisition-time, Fast Lock Mode	Measured at 25.78125 Gbps, Adapt mode 2 (REG_0x31[6:5]=0x2). Fast Lock Mode Enabled (REG_0xAC[7] = 1). Adaptation process still runs to find the best CTLE/DFE values after CDR lock is declared.		<10		ms
	CDR lock acquisition-time, Fast Lock Mode	Measured at 25.78125 Gbps, Adapt mode 0 (Reg_0x31[6:5]=0x0), Fast Lock Mode Enabled (REG_0xAC[7] = 1). Adaptation process still runs to find the best CTLE/DFE values after CDR lock is declared.		<2		ms
t _{EQ_Adapt}	Total EQ Adaptation Completion Time (includes t _{LOCK})	Measured at 25.78125 Gbps, Adapt mode 2 (REG_0x31[6:5]=0x2) ⁽³⁾ ⁽⁴⁾		<3		s
RETIMER JITTER SPECIFICATIONS						
J _{TJ}	Output Total jitter (TJ)	Measured at 25.78125 Gbps to a probability level of 1E-12 with PRBS11 data pattern an evaluation board traces de-embedded		0.16		U _{Ipp} @ 1E-12
J _{RJ}	Output Random Jitter (RJ)	Measured at 25.78125 Gbps to a probability level of 1E-12 with PRBS11 data pattern an evaluation board traces de-embedded		6.8		mUI RMS
J _{DCCD}	Output Duty Cycle Distortion (DCCD)	Measured at 25.78125 Gbps to a probability level of 1E-12 with PRBS11 data pattern an evaluation board traces de-embedded		3.7		mUI _{pp}
HIGH-SPEED DIFFERENTIAL INPUTS (RXnP, RXnN)						
V _{IDMax}	Maximum tolerable input differential voltage	For normal operation		1200		mV _{ppd}
V _{cm-Self}	Self-generated input common mode			1.79		V
R _{L-SDD11}	Differential input return loss, SDD11 ⁽⁵⁾	Between 50 MHz and 3.69 GHz		-20		dB
	Differential input return loss, SDD11 ⁽⁵⁾	Between 3.69 GHz and 12.9 GHz		-13		dB
R _{L-SDC11}	Common-mode to differential input return loss, SDC11 ⁽⁵⁾	Between 50 MHz and 12.9 GHz		-23		dB
R _{L-SCD11}	Differential to common-mode input return loss, SCD11 ⁽⁵⁾	Between 50 MHz and 12.9 GHz		-23		dB
R _{L-SCC11}	Common-mode input return loss, SCC11 ⁽⁵⁾	Between 150 MHz and 10 GHz		-11		dB

7.8 Typical Characteristics

8 Detailed Description

8.1 Overview

The DS250DF230 is a dual-channel multi-rate retimer with integrated signal conditioning. Each of the two channels operates independently. Each channel includes a continuous-time linear equalizer (CTLE) and a Decision Feedback Equalizer (DFE), which together compensate for the presence of a dispersive transmission channel between the source transmitter and the DS250DF230 receiver. The CTLE and DFE are self-adaptive.

Each channel includes an independent voltage-controlled oscillator (VCO) and phase-locked loop (PLL) which produce a clean clock that is frequency-locked to the clock embedded in the input data stream. The high-frequency jitter on the incoming data is attenuated by the PLL, producing a clean clock with substantially reduced jitter. This clean clock is used to re-time the incoming data, removing high-frequency jitter from the data stream and reproducing the data on the output with significantly reduced jitter.

Each channel of the DS250DF230 features an output driver with adjustable differential output voltage and output equalization in the form of a three-tap finite impulse response (FIR) filter. The output FIR compensates for dispersion in the transmission channel at the output of the DS250DF230.

A full 2x2 cross-point switch is integrated inside. This allows multiplexing and de-multiplexing/fanout applications for fail-over redundancy, as well as cross-over applications to aid PCB routing.

Each channel also includes diagnostic features such as a Pseudo-Random Bit Sequence (PRBS) pattern generator and checker, as well as a non-destructive, eye-opening monitor (EOM). The EOM can be used to plot the post-equalized eye at the input to the decision slicer or simply to read the horizontal eye opening (HEO) and vertical eye opening (VEO).

The DS250DF230 is configurable through a single SMBus port. The DS250DF230 can also act as an SMBus master to configure itself from an external EEPROM. Up to sixteen DS250DF230 devices can share a single SMBus.

The sections which follow describe the functionality of various circuits and features within the DS250DF230. For more information about how to program or operate these features, consult the [DS250DF230 Programmer's Guide](#) (SNLU182).

8.2 Functional Block Diagram

8.3 Feature Description

8.3.1 Device Data Path Operation

The DS250DF230 data path consists of several key blocks as shown in the functional block diagram. These key circuits are:

- [Signal Detect](#)
- [Continuous Time Linear Equalizer \(CTLE\)](#)
- [Variable Gain Amplifier \(VGA\)](#)
- [Cross-Point Switch](#)
- [Decision Feedback Equalizer \(DFE\)](#)
- [Clock and Data Recovery \(CDR\)](#)
- [Calibration Clock](#)
- [Differential Driver With FIR Filter](#)

8.3.2 Signal Detect

The DS250DF230 receiver contains a signal detect circuit. The signal detect circuit monitors the energy level on the receiver inputs and powers on or off the rest of the high-speed data path if a signal is detected or not. By default, each channel allows the signal detect circuit to automatically power on or off the rest of the high-speed data path depending on the presence of an input signal. The signal detect block can be manually controlled in the SMBus channel registers. This can be useful if it is desired to manually force channels to be disabled. For information on how to manually operate the signal detect circuit, refer to the [DS250DF230 Programmer's Guide](#) (SNLU182).

8.3.3 Continuous Time Linear Equalizer (CTLE)

The CTLE in the DS250DF230 is a fully-adaptive equalizer. The CTLE adapts according to a Figure of Merit (FOM) calculation during the lock acquisition process. The FOM calculation is based upon the horizontal eye opening (HEO) and vertical eye opening (VEO). Once the CDR locks and the CTLE adapts, the CTLE boost level is frozen until a manual re-adapt command is issued or until the CDR re-enters the lock acquisition state. The CTLE can be re-adapted by resetting the CDR.

The CTLE consists of 4 stages, with each stage having 2-bit boost control. This allows for many boost combinations, including bypassing the first three stages EQs. The CTLE adaption algorithm allows the CTLE to adapt through 20 of these boost combinations. These 20 boost combinations comprise the EQ Table in the channel registers. See channel registers 0x40 through 0x53.

The boost levels can be set between approximately 0 dB and 25 dB (at 12.89 GHz.)

8.3.4 Variable Gain Amplifier (VGA)

The DS250DF230 receiver implements a VGA. The VGA assists in the recovery of extremely small signals, working in conjunction with the CTLE to equalize and scale amplitude. The VGA has 1-bit control through Reg_0x8E[0], and the VGA is in the low-gain state (Reg_0x8E[0]=0) by default. In addition to the VGA, the CTLE implements its own gain control through Reg_0x13[5] to adjust the DC amplitude similar to the VGA. For more information on how to configure the VGA and EQ gain, refer to the [DS250DF230 Programmer's Guide](#) (SNLU182).

8.3.5 Cross-Point Switch

DS250DF230 has a 2×2 cross-point that may be enabled to implement a 2-to-1 mux, a 1-to-2 fanout, or an A-to-B/B-to-A lane cross.

8.3.6 Decision Feedback Equalizer (DFE)

A 5-tap DFE can be enabled within the data path of each channel to assist in reducing the effects of crosstalk, reflections, or post-cursor, inter-symbol interference (ISI). The DFE must be manually enabled, regardless of the selected adapt mode. Once the DFE is enabled, it can be configured to adapt only during lock acquisition or to adapt continuously. The DFE can also be manually configured to specified tap polarities and tap weights. However, when the DFE is configured manually, the DFE auto-adaptation must be disabled. For many applications with lower insertion loss (that is, < 30 dB) lower crosstalk, and/or lower reflections, part or all of the DFE can be disabled to reduce power consumption. The DFE can either be fully enabled (taps 1-5), partially enabled (taps 1-2 only), or fully disabled (no taps). The DFE taps support continuous adaptation, the device is capable of compensating large channel loss variation over temperature

The DFE taps are all feedback taps with 1UI spacing. Each tap has a specified boost weight range and polarity bit.

Table 8-1. DFE Tap Weights

DFE PARAMETER	DECIMAL (REGISTER VALUE)	VALUE (mV) (TYP)
Tap 1 Weight Range	0 - 31	0 – 217
Tap 2-5 Weight Range	0 - 15	0 – 105
Tap Weight Step Size	NA	7
Polarity	0: (+) positive; feedback value creates a low-pass filter response, thus providing attenuation to correct for negative-sign, post-cursor ISI 1: (-) negative; Feedback value creates a high-pass filter response, thus providing boost to correct for positive-sign, post-cursor ISI.	

8.3.7 Clock and Data Recovery (CDR)

The CDR consists of a Phase-Locked Loop (PLL), PPM counter, and Input and Output Data Multiplexers (mux) that allow for retimed data, non-retimed data, a PRBS generator, and output muted modes.

By default, the equalized data is fed into the CDR for clock and data recovery. The recovered data is then output to the FIR filter and differential driver together with the recovered clock that was cleaned of any high-frequency jitter outside the bandwidth of the CDR clock recovery loop. The bandwidth of the CDR defaults to 4.7 MHz (typical) in full-rate (divide-by-1) mode and 4 MHz (typical) in sub-rate mode. The CDR bandwidth is adjustable. Refer to the [DS250DF230 Programmer's Guide](#) (SNLU182) for more information on adjusting the CDR bandwidth. Users can configure the CDR data to route the recovered clock and data to the PRBS checker. Users also have the option of configuring the output of the CDR to send raw non-retimed data, or data from the pattern generator.

The CDR requires these items for proper configuration:

- A 30.72-MHz or 25-MHz calibration clock to run the PPM counter (CAL_CLK_IN).
- Expected data rates must be programmed into the CDR either through the rate table or entered manually with the corrected divider settings. Refer to the [DS250DF230 Programmer's Guide](#) (SNLU182) for more information on configuring the CDR for different data rates.

The DS250DF230 offers a low-speed recovered clock for channel 0. This feature is useful for the cases when recovered clock from FPGA or ASIC has in-band spurs on the phase noise plot because of the digital switching noise. See the [Table 8-6](#) for the recovered clock frequency versus input data rate.

8.3.7.1 CDR Bypass (Raw) Mode

When DS250DF230 is configured to CDR Bypass (Raw) Mode, the output differential voltage amplitude of the transmitter is adjustable. See the $V_{OD_Raw_L}$ and $V_{OD_Raw_H}$ parameters from [Electrical Characteristics](#). When switching from Raw Mode to Retimed Mode (CDR Enabled), REG_0x1A[7:6] and REG_0x0D[0] values need to be changed back to default. Refer to the [DS250DF230 Programmer's Guide](#) (SNLU182) for more information.

8.3.7.2 CDR Fast Lock Mode

The DS250DF230 offers a CDR Fast Lock Mode option to enable a CDR lock time as fast as 2 ms. See CDR lock time parameter in [Electrical Characteristics](#).

Normally, CDR acquisition lock time is gated by multiple factors, most notably until a minimum horizontal and vertical eye opening (HEO/VEO) is observed at the receiver, causing typical CDR lock times of up to 100 ms. In CDR Fast Lock Mode, the DS250DF230 outputs retimed data as soon as CDR lock is achieved based on PPM tolerance and VCO input comparator voltage requirements, removing minimum HEO/VEO requirements. This results in active retimed output data within 10 ms or less. Meanwhile, the EQ adaptation continues to run in the background and adjusts CTLE and DFE settings until optimal. As a result, when in CDR Fast Lock Mode, there may be bit errors observed in the retimed data output until EQ adaptation completes.

Note

CDR Fast Lock Mode is intended only for use cases with low input insertion loss where some retimer input eye opening can be ensured for all CTLE table indices. For channels >6dB IL at 13 GHz, it is recommended to disable CDR fast lock and instead decrease the EOM timer threshold (EOM_TIMER_THR) value to reduce the CDR lock acquisition time.

8.3.8 Calibration Clock

The calibration clock is not part of the CDR's PLL and thus is not used for clock and data recovery. The calibration clock is connected only to the PPM counter for each CDR. The PPM counter constrains the allowable lock ranges of the CDR according to the programmed values in the rate table or the manually entered data rates. The host must provide an input calibration clock signal of 30.72-MHz or 25-MHz frequency. This clock is not used for clock and data recovery, thus there are no stringent jitter requirements placed on this calibration clock.

8.3.9 Differential Driver With FIR Filter

The DS250DF230 output driver has a three-tap finite impulse response (FIR) filter which allows for pre- and post-cursor equalization to compensate for a wide variety of output channel media. The filter consists of a weighted sum of three consecutive retimed bits as shown in [Figure 8-1](#). C[0] can take on values in the range [-31, +31]. C[-1] and C[+1] can take on values in the range [-15, 15].

Figure 8-1. FIR Filter Functional model

When using the FIR filter, it is important to abide by these general rules:

- $|C[-1]| + |C[0]| + |C[+1]| \leq 31$; the FIR tap coefficients absolute sum must be less or equal to 31
- $\text{sgn}(C[-1]) = \text{sgn}(C[+1]) \neq \text{sgn}(C[0])$, for high-pass filter effect; the sign for the pre-cursor and/or post-cursor tap must be different from main-cursor tap to realize boost effect
- $\text{sgn}(C[-1]) = \text{sgn}(C[+1]) = \text{sgn}(C[0])$, for low-pass filter effect; the sign for the pre-cursor and/or post-cursor tap must be equal to the main-cursor tap to realize attenuation effect

The FIR filter is used to pre-distort the transmitted waveform to compensate for frequency-dependant loss in the output channel. The most common way of pre-distorting the signal is to accentuate the transitions and de-emphasize the non-transitions. The bit before a transition is accentuated through the pre-cursor tap, and the bit after the transition is accentuated through the post-cursor tap. The waveforms in [Figure 8-2](#) through [Figure 8-4](#) give a conceptual illustration of how the FIR filter affects the output waveform. These characteristics can be derived from the example waveforms:

- $VOD_{pk-pk} = v_7 - v_8$
- $VOD_{low-frequency} = v_2 - v_5$
- $Rpre_{dB} = 20 \times \log_{10}(v_3/v_2)$
- $Rpst_{dB} = 20 \times \log_{10}(v_1/v_2)$

Figure 8-2. Conceptual FIR Waveform With Post-Cursor Only

Figure 8-3. Conceptual FIR Waveform With Pre-Cursor Only

Figure 8-4. Conceptual FIR Waveform With Both Pre- and Post-Cursor

8.3.9.1 Setting the Output V_{OD} , Pre-Cursor, and Post-Cursor Equalization

The output differential voltage (V_{OD}), pre-cursor, and post-cursor equalization of the driver is controlled by manipulating the FIR tap settings. The main cursor tap is the primary knob for amplitude adjustment. The pre- and post-cursor FIR tap settings can then be adjusted to provide equalization. To maintain a constant peak-to-peak VOD, the user must adjust the main cursor tap value relative to the pre- and post-cursor tap changes so as to maintain a constant absolute sum of the FIR tap values. Table 8-2 shows various settings for V_{OD} settings ranging from 350 mVpp to 1195 mVpp (typical). Note that the output peak-to-peak amplitude is a function of the sum of the absolute values of the taps, whereas the low-frequency amplitude is purely a function of the main-cursor value.

Table 8-2. Typical VOD and FIR Values

The recommended pre-cursor and post-cursor settings for a given channel will depend on the channel characteristics (mainly insertion loss) as well as the equalization capabilities of the downstream receiver. The DS250DF230 receiver, with its highly-capable CTLE and DFE, does not require a significant amount of pre- or post-cursor. The guidelines in Figure 8-5 through Figure 8-7 give general recommendations for pre- and post-cursor for different channel loss conditions. The insertion loss (IL) in these plots refers to the total loss between the link partner transmitter and the DS250DF230 receiver.

Figure 8-5. Guideline for Link Partner FIR Settings When IL ≤ 15 dB

Figure 8-6. Guideline for Link Partner FIR Settings When IL ≤ 25 dB

Figure 8-7. Guideline for Link Partner FIR Settings When IL ≤ 35 dB

8.3.9.2 Output Driver Polarity Inversion

In some applications, it may be necessary to invert the polarity of the data transmitted from the retimer. To invert the polarity of the data, read back the FIR polarity settings for the pre-, main and post-cursor taps and then invert these bits.

8.3.9.3 Slow Slew Rate

In some low speed applications, it may be needed to adjust the slew rate of the data transmitted from the retimer. DS250DF230 does offer this option. See output transition-time parameter from [Electrical Characteristics](#). It is not recommended to use the slow rate setting for divide-by-1 data rate applications.

8.3.10 Debug Features

8.3.10.1 Pattern Generator

Each channel in the DS250DF230 can be configured to generate a 16-bit user-defined data pattern or a pseudo-random bit sequence (PRBS). The user defined pattern can also be set to automatically invert every other 16-bit symbol for DC balancing purposes. The DS250DF230 pattern generator supports the following PRBS sequences:

- PRBS – $2^7 - 1$
- PRBS – $2^9 - 1$
- PRBS – $2^{11} - 1$
- PRBS – $2^{15} - 1$
- PRBS – $2^{23} - 1$
- PRBS – $2^{31} - 1$

8.3.10.2 Pattern Checker

The pattern checker can be manually set to look for specific PRBS sequences and polarities or it can be set to automatically detect the incoming pattern and polarity. The PRBS checker supports the same set of PRBS patterns as the PRBS generator.

The pattern checker consists of an 11-bit error counter. The pattern checker uses 32-bit words, but every bit in the word is checked for error, so the error count represents the count of single bit errors.

To read out the bit and error counters, the pattern checker must first be frozen. Continuous operation with simultaneous read out of the bit and error counters is not supported in this implementation. Once the bit and error counter is read, they can be unfrozen to continue counting.

8.3.10.3 Eye-Opening Monitor

The DS250DF230's Eye-Opening Monitor (EOM) measures the internal data eye at the input of the decision slicer and can be used for 2 functions:

1. Horizontal Eye Opening (HEO) and Vertical Eye Opening (VEO) measurement
2. Full Eye Diagram Capture

The HEO measurement is made at the 0 V crossing and is read in channel register 0x27. The VEO measurement is made at the 0.5 UI mark and is read in channel register 0x28. The HEO and VEO registers can be read from channel registers 0x27 and 0x28 at any time while the CDR is locked. The following equations are used to convert the contents of channel registers 0x27 and 0x28 into their appropriate units:

- $\text{HEO [UI]} = \text{Reg_0x27} \div 32$
- $\text{VEO [mV]} = \text{Reg_0x28} \times 3.125$

A full eye diagram capture can be performed when the CDR is locked. The eye diagram is constructed within a 64×64 array, where each cell in the matrix consists of an 16-bit word representing the total number of hits recorded at that particular phase and voltage offset. Users can manually adjust the vertical scaling of the EOM or allow the state machine to control the scaling which is the default option. The horizontal scaling controlled by the state machine is always directly proportional to the data rate.

When a full eye diagram plot is captured, the retimer will shift out four 16-bit words of residual data that must be discarded followed by 4096 16-bit words that make up the 64×64 eye plot. The first actual word of the eye plot from the retimer is for (X, Y) position (0,0), which is the earliest position in time and the most negative position in voltage. Each time the eye plot data is read out, the voltage position is incremented. Once the voltage position has incremented to position 63 (the most positive voltage), the next read will cause the voltage position to reset to 0 (the most negative voltage) and the phase position to increment. This process will continue until the entire 64×64 matrix is read out. Figure 8-8 shows the EOM read out sequence overlaid on top of a simple eye opening plot. In this plot any hits are shown in green. This type of plot is helpful for quickly visualizing the HEO and VEO. Users can apply different algorithms to the output data to plot density or color gradients to the output data.

Figure 8-8. EOM Full Eye Capture Readout

To manually control the EOM vertical range, remove scaling control from the state machine then select the desired range:

Channel Reg 0x2C[6] → 0 (see Table 8-3).

Table 8-3. Eye-Opening Monitor Vertical Range Settings

CH REG 0x11[7:6] VALUE	EOM VERTICAL RANGE [mV]
2'b00	±100
2'b01	±200
2'b10	±300
2'b11	±400

The EOM operates as an under-sampled circuit. This allows the EOM to be useful in identifying over equalization, ringing and other gross signal conditioning issues. However, the EOM cannot be correlated to a bit error rate.

The EOM can be accessed in two ways to read out the entire eye plot:

- Multi-byte reads can be used such that data is repeatedly latched out from channel register 0x25.
- With single byte reads, the MSB are located in register 0x25 and the LSB are located in register 0x26. In this mode, the device must be addressed each time a new byte is read.

To perform a full eye capture with the EOM, follow the steps listed in Table 8-4 within the desired channel register set:

Table 8-4. Eye-Opening Monitor Full Eye Capture Instructions

STEP	REGISTER [bits]	Operation	VALUE	DESCRIPTION
1	0x67[5]	Write	0	Disable lock EOM lock monitoring
2	0x2C[6]	Write	0	Set the desired EOM vertical range
	0x11[7:6]	Write	2'b--	
3	0x11[5]	Write	0	Power on the EOM
4	0x24[7]	Write	1	Enable fast EOM
5	0x24[0]	Read	1	Begin read out of the 64 × 64 array, discard first 4 words Ch reg 0x24[0] is self-clearing.
	0x25			0x25 is the MSB of the 16-bit word
	0x26			0x26 is the LSB of the 16-bit word
6	0x25	Read		Continue reading information until the 64 × 64 array is complete.
	0x26			
7	0x67[5]	Write	1	Return the EOM to its original state. Undo steps 1-4
	0x2C[6]	Write	1	
	0x11[5]	Write	1	
	0x24[7]	Write	0	

8.3.11 Interrupt Signals

The DS250DF230 can be configured to report different events as interrupt signals. These interrupt signals do not impact the operation of the device, but merely report that the selected event has occurred. The interrupt bits in the register sets are all sticky bits. This means that when an event triggers an interrupt the status bit for that interrupt is set to logic HIGH. This interrupt status bit will remain at logic HIGH until the bit has been read. Once the bit has been read it will be automatically cleared, which allows for new interrupts to be detected. The DS250DF230 will report the occurrence of an interrupt through the INT_N pin. The INT_N pin is an open-drain output that will pull the line low when an interrupt signal is triggered.

Note that all available interrupts are disabled by default. Users must activate the various interrupts before they can be used.

The interrupts available in the DS250DF230 are:

- CDR loss of lock
- CDR locked
- Signal detect loss
- Signal detected
- PRBS pattern checker bit error detected
- HEO/VEO threshold violation

When an interrupt occurs, share register 0x08 reports which channel generated the interrupt request. Users can then select one or more of the channels that generated the interrupt request and service the interrupt by reading the appropriate interrupt status bits in the corresponding channel registers. For more information on reading interrupt status, refer to the [DS2x0DF810](#), [DS250DFx10](#), [DS250DF230 Programmer's Guide](#).

8.4 Device Functional Modes

8.4.1 Supported Data Rates

The DS250DF230 supports a wide range of input data rates, including divide-by-2 and divide-by-4 sub-rates. The supported data rates are listed in [Table 8-5](#).

Table 8-5. Supported Data Rates

DATA RATE RANGE		DIVIDER	CDR MODE	COMMENT
MIN	MAX			
≥ 19.6 Gbps	≤ 25.8 Gbps	1	Enabled	
> 12.9 Gbps	<19.6 Gbps	N/A	Bypassed	Output jitter will be higher with CDR bypassed.
≥ 9.8 Gbps	≤ 12.9 Gbps	2	Enabled	
> 6.45 Gbps	< 9.8 Gbps	N/A	Bypassed	Output jitter will be higher with CDR bypassed.
≥ 4.9 Gbps	6.45 ≤ Gbps	4	Enabled	
	< 4.9 Gbps	N/A	Bypassed	Output jitter will be higher with CDR bypassed.

The device can be configured to operate at different standard data rates by programming the Rate/Sub-Rate register Reg_2F[7:4]. For more information on data rate programming, refer to the [DS2x0DF810](#), [DS250DFx10](#), [DS250DF230 Programmer's Guide](#).

Table 8-6. Rate/Sub-Rate Table⁽¹⁾

RATE Reg_0x2F[7:4]	Standard	Input Data Rates [Gbps]	Recovered Clock Frequency [MHz]
0	CPRI Option 9	12.16512	30.72
1	CPRI Option 7	9.83040	30.72
2	CPRI Option 8	10.13760	30.72
3	CPRI Option 10	24.33024	30.72
4	CPRI Option 5	4.91520	30.72
5 (Default)	100GbE	25.78125	32.2265625
6	100GbE/ 40GbE/ 10GbE	25.78125	32.2265625
		10.31250	32.2265625
7	40GbE/ 10GbE	10.31250	32.2265625
8	CPRI Option 6	6.14400	30.72

- (1) This table is valid only when the calibration clock is 30.72-MHz. Refer to the [DS2x0DF810](#), [DS250DFx10](#), [DS250DF230 Programmer's Guide](#) for more information.

8.4.2 SMBus Master Mode

SMBus master mode allows the DS250DF230 to program itself by reading directly from an external EEPROM. When using the SMBus master mode, the DS250DF230 will read directly from specific location in the external EEPROM. When designing a system for using the external EEPROM, the user must follow these specific guidelines:

- Maximum EEPROM size is 2048 Bytes
- Minimum EEPROM size for a single DS250DF230 with individual channel configuration is 161 Bytes (3 base header bytes + 12 address map bytes + 2 × 72 channel register bytes + 2 share register bytes; bytes are defined to be 8-bits)
- Set ENSMB = Float, for SMBus master mode
- The external EEPROM device address byte must be 0xA0
- The external EEPROM device must support 400kHz operation at 2.5-V or 3.3-V supply
- THR pin is pulled low by 1 kΩ to GND, so that DS250DF230 is working under 2.5-V/3.3-V SMBus interface mode
- Set the SMBus address of the DS250DF230 by configuring the ADDR0 and ADDR1 pins

When loading multiple DS250DF230 devices from the same EEPROM, use these guidelines to configure the devices:

- Configure the SMBus addresses for each DS250DF230 to be sequential. The first device in the sequence must have an address of 0x30
- Daisy chain READ_EN_N and ALL_DONE_N from one device to the next device in the sequence so that they do not compete for the EEPROM at the same time.
- If all of the DS250DF230 devices share the same EEPROM channel and share register settings, configure the common channel bit in the base header to 1. With common channel configuration enabled, each DS250DF230 device will configure all 2 channels with the same settings.

When loading a single DS250DF230 from an EEPROM, use these guidelines to configure the device:

- Set the common channel bit to 0 to allow for individual channel configuration, or set the common channel bit to 1 to load the same configuration settings to all channels.
- When configuring individual channels, a 512, 1024 or 2048 Byte EEPROM must be used.
- If there are more than three DS250DF230 devices on a PCB that require individual channel configuration, then each device must have its own EEPROM.

8.4.3 Device SMBus Address

The DS250DF230's SMBus slave address is strapped at power up using the ADDR[1:0] pins. The pin state is read on power up, after the internal power-on reset signal is de-asserted. The ADDR[1:0] pins are four-level LVCMOS IOs, which provides for 16 unique SMBus addresses. The four levels are achieved by pin strap options as follows:

- 0: 1 kΩ to GND
- R: 10 kΩ to GND (20 kΩ also acceptable)
- F: Float
- 1: 1 kΩ to VDD

Table 8-7. SMBus Address Map

8-BIT WRITE ADDRESS [HEX]	REQUIRED ADDRESS PIN STRAP VALUE	
	ADDR1	ADDR0
0x30	0	0
0x32	0	R
0x34	0	F
0x36	0	1
0x38	R	0
0x3A	R	R
0x3C	R	F
0x3E	R	1
0x40	F	0
0x42	F	R
0x44	F	F
0x46	F	1
0x48	1	0
0x4A	1	R
0x4C	1	F
0x4E	1	1

8.5 Programming

8.5.1 Bit Fields in the Register Set

Many of the registers in the DS250DF230 are divided into bit fields. This allows a single register to serve multiple purposes which may be unrelated. Often, configuring the DS250DF230 requires writing a bit field that makes up only part of a register value while leaving the remainder of the register value unchanged. The procedure for accomplishing this task is to read in the current value of the register to be written, modify only the desired bits in this value, and write the modified value back to the register. Of course, if the entire register is to be changed, rather than just a bit field within the register, it is not necessary to read in the current value of the register first. In all register configuration procedures described in the following sections, this procedure must be kept in mind. In some cases, the entire register is to be modified. When only a part of the register is to be changed, however, the procedure described above must be used.

Most register bits can be read or written to. However, some register bits are constrained to specific interface instructions.

Register bits can have the following interface constraints:

- R - Read only
- RW - Read/Write
- RWSC - Read/Write, self-clearing

8.5.2 Writing to and Reading from the Global/Shared/Channel Registers

The DS250DF230 has 3 types of registers:

1. Global Registers – These registers can be accessed at any time and are used to select individual channel registers, the shared registers or to read back the TI ID and version information.
2. Shared Registers – These registers are used for device-level configuration, status read back or control.
3. Channel Registers – These registers are used to control and configure specific features for each individual channel. All channels have the same channel register set and can be configured independent of each other.

The global registers can be accessed at any time, regardless of whether the shared or channel register set is selected. The DS250DF230 global registers are located on addresses 0xEF-0xFF. The function of the global registers falls into the following categories:

- Channel selection and share enabling – Registers 0xFC and 0xFF
- Device and version information – Registers 0xEF-0xF3
- Reserved/unused registers – all other addresses

Register 0xFC is used to select the channel registers to be written to. To select a channel, write a 1 to its corresponding bit in register 0xFC. Note that more than one channel may be written to by setting multiple bits in register 0xFC. However, when performing an SMBus read transaction only one channel can be selected at a time. If multiple channels are selected in register 0xFC when attempting to perform an SMBus read, the device will return 0xFF.

Register 0xFF bit 1 can be used to perform broadcast register writes to all channels. A single channel read-modify broadcast write type commands can be accomplished by setting register 0xFF to 0x03 and selecting a single channel in register 0xFC. This type of configuration allows for the reading of a single channel's register information and then writing to all channels with the modified value. Register 0xFF bit 0 is used to select the shared register page or the channel register page for the channels selected in register 0xFC.

TI repeaters/retimers have a vendor ID register (0xFE) which will always read back 0x03. In addition, there are three device ID registers (0xF0, 0xF1, and 0xF3). These are useful to verify that there is a good SMBus connection between the SMBus master and the DS250DF230.

	3	0	RW	N	RESERVED	RESERVED
	2	0	RW	N	PRBS_PATTERN_SEL[2]	MSB for the PRBS_PATTERN_SEL field. Lower bits are found on Reg_0x30[1:0]. Refer to the Reg_0x30 description on this table.
	1	0	RW	N	RESERVED	RESERVED
	0	0	RW	N	RESERVED	RESERVED

Table 8-10. Channel Registers, 0 to 39 (continued)

ADDRESS (HEX)	BITS	DEFAULT VALUE (HEX)	MODE	EEPROM	FIELD NAME	DESCRIPTION
2F	7	0	RW	Y	RESERVED	RESERVED
	6	1	RW	Y	RATE[2]	Configure PPM register and divider for a standard data rate. (Refer to the Programming Guide for more details)
	5	0	RW	Y	RATE[1]	
	4	1	RW	Y	RATE[0]	
	3	0	RW	Y	INDEX_OV	If this bit is 1, then Reg_0x39 is to be used as 4-bit index to the [15:0] array of EQ settings. The EQ setting at that index is loaded to the EQ boost registers going to the analog and is used as the starting point for adaption.
	2	1	RW	Y	EN_PPM_CHECK	1: (Default) Enable the PPM to be used as a qualifier when performing Lock Detect 0: Remove the PPM check as a lock qualifier.
	1	0	RW	Y	RESERVED	DS250DF230: 1: Disable eq_bypass for first 4 indices 0: Enable eq_bypass for first 4 indices
	0	0	RWSC	N	CTLE_ADAPT	1: Re-starts CTLE adaptation, self-clearing

Table 8-10. Channel Registers, 0 to 39 (continued)

ADDRESS (HEX)	BITS	DEFAULT VALUE (HEX)	MODE	EEPROM	FIELD NAME	DESCRIPTION
30	7	0	RW	N	FREEZE_PPM_CNT	1: Freeze the PPM counter to allow safe read asynchronously
	6	0	RW	Y	EQ_SEARCH_OV_EN	1: Enables the EQ 'search' bit to be forced by Reg_0x13[2]
	5	0	RW	N	EN_PATT_INV	1: Enable automatic pattern inversion of successive 16 bit words when using the "Fixed Pattern" generator option.
	4	0	RW	N	RELOAD_PRBS_CHKCR	1: Force reload of seed into PRBS checker LFSR without holding the checker in reset.
	3	0	RW	N	PRBS_EN_DIG_CLK	This bit enables the clock to operate the PRBS generator and/or the PRBS checker. Toggling this bit is the primary method to reset the PRBS pattern generator and PRBS checker.
	2	0	RW	N	PRBS_PROGPATT_EN	Enable a fixed data pattern output. Requires that serializer is enabled with Reg_0x1E[4]. PRBS generator and checker should be disabled, Reg_0x30[3]. The fixed data pattern is set by Reg_0x7C and Reg_0x97. Enable inversion of the pattern every 16 bits with Reg_0x30[5].
	1	0	RW	N	PRBS_PATTERN_SEL[1]	Selects the pattern output when using the PRBS generator. Requires the pattern generator to be configured properly. The MSB for the PRBS_PATTERN_SEL field is in Reg_0x2E[2]. Use Reg_0x30[3] to enable the PRBS generator. 000: 2 ⁷ -1 bits PRBS sequence 001: 2 ⁹ -1 bits PRBS sequence 010: 2 ¹¹ -1 bits PRBS sequence 011: 2 ¹⁵ -1 bits PRBS sequence 100: 2 ²³ -1 bits PRBS sequence 101: 2 ³¹ -1 bits PRBS sequence 110: 2 ⁵⁸ -1 bits PRBS sequence 111: 2 ⁶³ -1 bits PRBS sequence
	0	0	RW	N	PRBS_PATTERN_SEL[0]	

Table 8-10. Channel Registers, 0 to 39 (continued)

ADDRESS (HEX)	BITS	DEFAULT VALUE (HEX)	MODE	EEPROM	FIELD NAME	DESCRIPTION
31	7	0	RW	N	PRBS_INT_EN	1: Enables interrupt for detection of PRBS errors. The PRBS checker must be properly configured for this feature to work.
	6	0	RW	Y	ADAPT_MODE[1]	00: no adaption
	5	1	RW	Y	ADAPT_MODE[0]	01: adapt CTLE only 10: adapt CTLE until optimal, then DFE, then CTLE again 11: adapt CTLE until lock, then DFE, then EQ until optimal Note: for ADAPT_MODE=2 or 3, the DFE must be enabled by setting Reg_0x1E[3]=0 and Reg_0x1E[1]=1. (Refer to the Programming Guide for more details)
	4	0	RW	Y	EQ_SM_FOM[1]	CTLE (EQ) adaption state machine figure of merit. 00: (Default) SM uses both HEO and VEO 01: SM uses HEO only 10: SM uses VEO only 11: SM uses both HEO and VEO Additionally, if Reg_0x6E[7]=1, the Alternate FOM is used. Reg_0x6E[7] takes precedence over EQ_SM_FOM.
	3	0	RW	Y	EQ_SM_FOM[0]	
	2	0	RW	N	RESERVED	RESERVED
	1	0	RW	Y	CDR_LOCK_LOSS_INT_EN	Enable for CDR Lock Loss Interrupt. Observable in Reg_0x01[5]
	0	0	RW	Y	SIGNAL_DET_LOSS_INT_EN	Enable for Signal Detect Loss Interrupt. Observable in Reg_0x01[0]
32	7	0	RW	Y	HEO_INT_THRESH[3]	These bits set the threshold for the HEO and VEO interrupt. Each threshold bit represents 8 counts of HEO or VEO.
	6	0	RW	Y	HEO_INT_THRESH[2]	
	5	0	RW	Y	HEO_INT_THRESH[1]	
	4	1	RW	Y	HEO_INT_THRESH[0]	
	3	0	RW	Y	VEO_INT_THRESH[3]	
	2	0	RW	Y	VEO_INT_THRESH[2]	
	1	0	RW	Y	VEO_INT_THRESH[1]	
	0	1	RW	Y	VEO_INT_THRESH[0]	

Table 8-10. Channel Registers, 0 to 39 (continued)

ADDRESS (HEX)	BITS	DEFAULT VALUE (HEX)	MODE	EEPROM	FIELD NAME	DESCRIPTION
33	7	1	RW	Y	HEO_THRESH[3]	In adapt mode 3, the register sets the minimum HEO and VEO required for CTLE adaption, before starting DFE adaption. This can be a max of 15.
	6	0	RW	Y	HEO_THRESH[2]	
	5	0	RW	Y	HEO_THRESH[1]	
	4	0	RW	Y	HEO_THRESH[0]	
	3	1	RW	Y	VEO_THRESH[3]	
	2	0	RW	Y	VEO_THRESH[2]	
	1	0	RW	Y	VEO_THRESH[1]	
	0	0	RW	Y	VEO_THRESH[0]	
34	7	0	R	N	PPM_ERR_RDY	1: Indicates that a PPM error count is read to be read from channel Reg_0x3B and Reg_0x3C
	6	0	RW	Y	LOW_POWER_MODE_DISABLE	By default, all blocks (except signal detect) power down after 100 ms after signal detect goes low. If set high, all blocks get powered on after the signal detect initially goes high.
	5	1	RW	Y	LOCK_COUNTER[1]	After achieving lock, the CDR continues to monitor the lock criteria. If the lock criteria fail, the lock is checked for a total of N number of times before declaring an out of lock condition, where N is set by this the value in these registers, with a max value of +3, for a total of 4. If during the N lock checks, lock is regained, then the lock condition is left HI, and the counter is reset back to zero.
	4	1	RW	Y	LOCK_COUNTER[0]	
	3	1	RW	Y	DFE_MAX_TAP2_5[3]	These four bits are used to set the maximum value by which DFE taps 2-5 are able to adapt with each subsequent adaptation. Same used for both polarities.
	2	1	RW	Y	DFE_MAX_TAP2_5[2]	
	1	1	RW	Y	DFE_MAX_TAP2_5[1]	
	0	1	RW	Y	DFE_MAX_TAP2_5[0]	

Table 8-10. Channel Registers, 0 to 39 (continued)

ADDRESS (HEX)	BITS	DEFAULT VALUE (HEX)	MODE	EEPROM	FIELD NAME	DESCRIPTION
35	7	0	RW	Y	DATA_LOCK_PPM[1]	Modifies the value of the PPM delta tolerance from channel Reg_0x64: 00 - ppm_delta[7:0] =1 x ppm_delta[7:0] 01 - ppm_delta[7:0] =1 x ppm_delta[7:0] + ppm_delta[3:1] 10 - ppm_delta[7:0] =2 x ppm_delta[7:0] 11 - ppm_delta[7:0] =2 x ppm_delta[7:0] + ppm_delta[3:1]
	6	0	RW	Y	DATA_LOCK_PPM[0]	
	5	0	RW	N	GET_PPM_ERROR	Get PPM error from PPM_COUNT - clears when done. Normally updates continuously, but can be manually triggered with read value from Reg_0x3B and Reg_0x3C
	4	0	RW	Y	DFE_MAX_TAP1[4]	Limits DFE tap 1 maximum magnitude.
	3	1	RW	Y	DFE_MAX_TAP1[3]	
	2	1	RW	Y	DFE_MAX_TAP1[2]

	1	0	RW	Y	EQ_LB_CNT[1]	
	0	1	RW	Y	EQ_LB_CNT[0]	
71	7	0	R	N	PRBS_INT	When enabled by Reg_0x31[7], goes HI if a PRBS stream is detected. Clears on reading. PRBS checker must be enabled with Reg_0x30[3]. Once cleared, if a PRBS error occurs, then the interrupt will again go HI. Clears on reading. If signal detect is lost, this is considered a PRBS error, and the interrupt will go HI. Clears on reading.

9 Application and Implementation

Note

Information in the following applications sections is not part of the TI component specification, and TI does not warrant its accuracy or completeness. TI's customers are responsible for determining suitability of components for their purposes, as well as validating and testing their design implementation to confirm system functionality.

9.1 Application Information

The DS250DF230 is a high-speed retimer which extends the reach of differential channels and cleans jitter and other signal impairments in the process. It can be deployed in a variety of different systems from backplanes to front ports to active cable assemblies. The following sections outline a few typical applications and their associated design considerations.

9.2 Typical Applications

The DS250DF230 is typically used in the following application scenarios:

1. [Front-Port Jitter Cleaning Applications](#)
2. [Active Cable Applications](#)
3. [Backplane and Mid-Plane Applications](#)

Figure 9-1. Typical Uses for the DS250DF230 in a System

9.2.1 Front-Port Jitter Cleaning Applications

The DS250DF230 has strong equalization capabilities that allow it to equalize insertion loss, reduce jitter, and extend the reach of front-port interfaces. Two pieces DS250DF230 can be used to support all four egress channels for a 100GbE port. Another two pieces DS250DF230 can be used to support all four ingress channels for the same 100GbE ports. Alternatively, a single DS250DF230 can be used to support all egress channels for two 25GbE ports, and another DS250DF230 can be used to support all two ingress channels for the same four 25GbE ports.

A flow-through pinout for the high-speed signals on DS250DF230 makes placement and routing easy for unidirectional application. By using the 2x2 cross point inside the device, DS250DF230 can also be configured for [Figure 9-2](#), where one single device supports both egress and ingress channels.

Figure 9-2. Bidirectional Application

For applications which require IEEE802.3 100GBASE-CR4 or 25GBASE-CR auto-negotiation and link training, a linear repeater device such as the [DS280BR820](#) (or similar) is recommended.

[Figure 9-3](#) shows this configuration, and [Figure 9-4](#) shows an example simplified schematic for a typical front-port application.

Figure 9-3. Front-Port Application Block Diagram

Figure 9-4. Front-Port Application Schematic

9.2.1.1 Design Requirements

For this design example, the following guidelines outlined in [Table 9-1](#) apply.

Table 9-1. Front-Port Application Design Guidelines

DESIGN PARAMETER	REQUIREMENT
AC-coupling capacitors	<i>Egress (ASIC-to-module) direction:</i> AC-coupling capacitors in the range of 100 to 220 nF are required for the RX inputs and are NOT required for the TX outputs. <i>Ingress (module-to-ASIC) direction:</i> AC-coupling capacitors in the range of 100 to 220 nF are required for the TX outputs and are NOT required for the RX inputs.
Input channel insertion loss	≤ 35 dB at 25.78125-Gbps Nyquist frequency (12.9 GHz)
Output channel insertion loss	<i>Egress (ASIC-to-module) direction:</i> Follow CAUI-4 / CEI-25G-VSR host channel requirements (approximately 7 dB at 12.9 GHz). <i>Ingress (module-to-ASIC) direction:</i> Depends on downstream ASIC / FPGA capabilities. The DS250DF230 has a low-jitter output driver with 3-tap FIR filter for equalizing a portion of the output channel.
Host ASIC TX launch amplitude	800 mVppd to 1200 mVppd.
Host ASIC TX FIR filter	Depends on channel loss. Refer to the Setting the Output V_{OD}, Pre-Cursor, and Post-Cursor Equalization section.

9.2.1.2 Detailed Design Procedure

The design procedure for front-port applications is as follows:

- Determine the total number of channels on the board which require a DS250DF230 for signal conditioning. This will dictate the total number of DS250DF230 devices required for the board. It is generally recommended that channels connected to the same front-port cage be grouped together in the same DS250DF230 device. This will simplify the device settings, as similar loss channels generally use similar settings.
- Determine the maximum current draw required for all DS250DF230 retimers. This may impact the selection of the regulator for the 2.5-V supply rail. To calculate the maximum current draw, multiply the maximum transient power supply current by the total number of DS250DF230 devices.
- Determine the maximum operational power consumption for the purpose of thermal analysis. There are two ways to approach this calculation:
 - Maximum mission-mode operational power consumption is when all channels are locked and re-transmitting the data which is received. PRBS pattern checkers/generators are not used in this mode because normal traffic cannot be checked with a PRBS checker. For this calculation, multiply the worst-case power consumption in mission mode by the total number of DS250DF230 devices.
 - Maximum debug-mode operational power consumption is when all channels are locked and re-transmitting the data which is received. At the same time, some channels' PRBS checkers or generators may be enabled. For this calculation, multiply the worst-case power consumption in debug mode by the total number of DS250DF230 devices.
- Determine the SMBus address scheme needed to uniquely address each DS250DF230 device on the board, depending on the total number of devices identified in step 2. Each DS250DF230 can be strapped with one of 16 unique SMBus addresses. If there are more DS250DF230 devices on the board than the number of unique SMBus addresses which can be assigned, then use an I2C expander like the **TCA/PCA family of I2C/SMBus switches and multiplexers** to split up the SMBus into multiple busses.
- Determine if the device will be configured from EEPROM (SMBus Master Mode) or from the system I2C bus (SMBus Slave Mode).
 - If SMBus Master Mode will be used, provisions must be made for an EEPROM on the board with 8-bit SMBus address 0xA0. Refer to [SMBus Master Mode](#) for more details on SMBus Master Mode including EEPROM size requirements.
 - If SMBus Slave Mode will be used for all device configurations, an EEPROM is not needed.
- Make provisions in the schematic and layout for standard decoupling capacitors between the device VDD supply and GND. Refer to the pin function description in [Pin Configuration and Functions](#) for more details.

7. Make provisions in the schematic and layout for a 30.72 MHz (± 100 ppm) or 25 MHz (± 100 ppm) single-ended CMOS clock. Each DS250DF230 retimer buffers the clock on the CAL_CLK_IN pin and presents the buffered clock on the CAL_CLK_OUT pin. This allows multiple (up to 20) retimers' calibration clocks to be daisy chained to avoid the need for multiple oscillators on the board. If the oscillator used on the board has a 2.5-V CMOS output, then no AC-coupling capacitor or resistor ladder is required at the input to CAL_CLK_IN. No AC coupling or resistor ladder is needed between one retimer's CAL_CLK_OUT output and the next retimer's CAL_CLK_IN input. The final retimer's CAL_CLK_OUT output can be left floating.
8. Connect the INT_N open-drain output to an FPGA or CPU if interrupt monitoring is desired. Note that multiple retimers' INT_N outputs can be connected together because this is an open-drain output. The common INT_N net must be pulled high.
9. If the application requires initial CDR lock acquisition at the ambient temperature extremes defined in [Recommended Operating Conditions](#), take care to ensure the operating junction temperature is met as well as the CDR stay-in-lock junction temperature range defined in [Electrical Characteristics](#). For example, if initial CDR lock acquisition occurs at an junction temperature of 110°C, then maintaining CDR lock would require the ambient temperature surrounding the DS250DF230 to be kept above (110°C – TEMP_LOCK-).

9.2.1.3 Application Curves

Figure 9-5 shows a typical output eye diagram for the DS250DF230 operating at 25.78125 Gbps with PRBS9 pattern using FIR main-cursor of +28, pre-cursor of 0 and post-cursor of +3. All other device settings are left at default.

Figure 9-6 shows an example of DS250DF230 FIR transmit equalization while operating at 25.78125 Gbps. In this example, the Tx FIR filter main-cursor is set to +25, post-cursor to -3 and pre-cursor to -3. An 8T pattern is used to evaluate the FIR filter, which consists of 0xFF00. All other device settings are left at default.

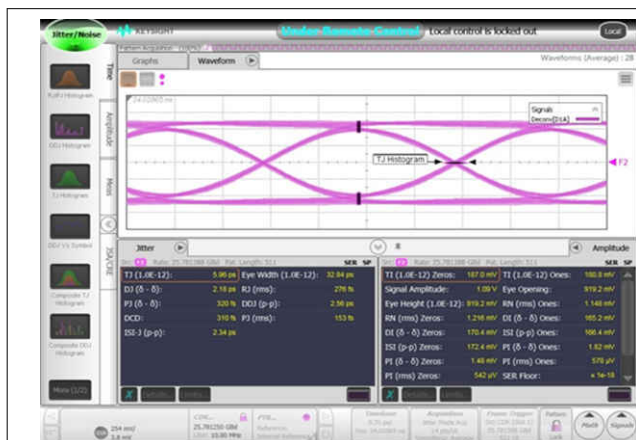

Figure 9-5. DS250DF230 Operating at 25.78125 Gbps

Figure 9-6. DS250DF230 FIR Transmit Equalization While Operating at 25.78125 Gbps

9.2.2 Active Cable Applications

The DS250DF230 has strong equalization capabilities that allow it to recover data over long and/or thin-gauge copper cables. Two pcs DS250DF230s can be used on a QSFP28 paddle card to create a half-active cable assembly which is longer and/or thinner than passive cables. Alternatively, four pcs DS250DF230 devices can be used on a QSFP28 paddle card to create a full-active cable assembly and achieve even longer reach and/or thinner cables.

Figure 9-7 shows these configurations, Figure 9-8 shows an example simplified schematic for a half-active cable application, and Figure 9-9 shows an example simplified schematic for a full-active cable application.

Figure 9-7. Active Cable Application Block Diagram

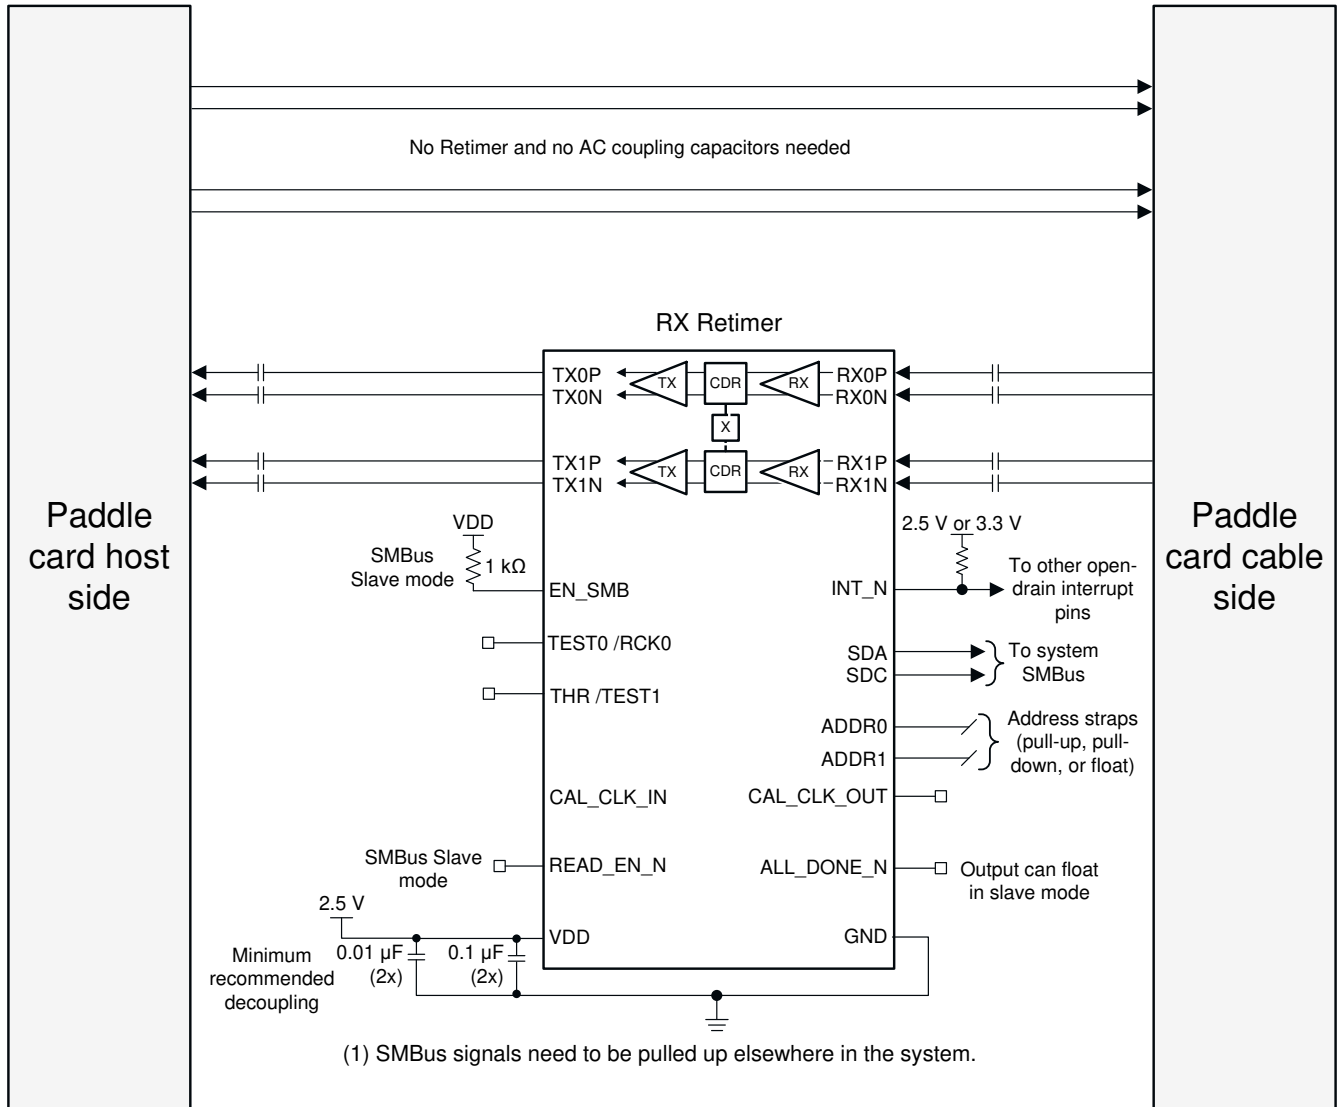

Figure 9-8. Half-Active Cable Application Schematic

(1) SMBus signals need to be pulled up elsewhere in the system.

Figure 9-9. Full-Active Cable Application Schematic

9.2.2.1 Design Requirements

For this design example, the following guidelines outlined in [Table 9-2](#) and [Table 9-3](#) apply.

Table 9-2. Half-Active Cable Application Design Guidelines

DESIGN PARAMETER	REQUIREMENT
Device placement	Place the DS250DF230s on the receive side of the paddle card such that it is receiving data from the cable, and transmitting towards the host.
AC-coupling capacitors	100-nF, AC-coupling capacitors are required for the RX inputs and the TX outputs.
Cable insertion loss	The raw cable insertion loss including the insertion loss of the paddle card must be ≤ 27 dB at 25.78125-Gbps Nyquist frequency (12.9 GHz). This is to ensure that the total loss at the input to the DS250DF230 is ≤ 35 dB at 12.9 GHz. Assuming a worst-case host-side PCB loss of 7 dB, plus a connector loss of 1 dB, the remaining loss allocated for the raw cable and paddle cards is 27 dB.

Table 9-3. Full-Active Cable Application Design Guidelines

DESIGN PARAMETER	REQUIREMENT
Device placement	A full-active QSFP cable will use 4 pieces of DS250DF230 per paddle card. Typically, two devices will be placed on each side of the paddle card.
AC-coupling capacitors	<i>Transmit-side Retimer:</i> 100-nF, AC coupling capacitors are required for the RX inputs and are not required for the TX outputs. This link segment will be AC coupled on the paddle card at the opposite end of the cable. <i>Receive-side Retimer:</i> 100-nF, AC-coupling capacitors are required for the RX inputs and the TX outputs.
Cable insertion loss	The raw cable insertion loss including the insertion loss of the paddle card must be ≤ 35 dB at 25.78125-Gbps Nyquist frequency (12.9 GHz).

9.2.2.2 Detailed Design Procedure

The design procedure for active cable applications is as follows:

- Determine the maximum current draw required for one or more of the DS250DF230 retimers on the paddle card. This may impact the selection of the regulator for the 2.5-V supply rail. To calculate the maximum current draw, multiply the maximum transient power supply current by the total number of DS250DF230 devices.
- Determine the maximum operational power consumption for the purpose of thermal analysis. There are two ways to approach this calculation:
 - Maximum mission-mode operational power consumption is when all channels are locked and re-transmitting the data which is received. PRBS pattern checkers/generators are not used in this mode because normal traffic cannot be checked with a PRBS checker. For this calculation, multiply the worst-case power consumption in mission mode by the total number of DS250DF230 devices.
 - Maximum debug-mode operational power consumption is when all channels are locked and re-transmitting the data which is received. At the same time, some channels' PRBS checkers or generators may be enabled. For this calculation, multiply the worst-case power consumption in debug mode by the total number of DS250DF230 devices.
- Determine the SMBus address for one or more of the DS250DF230 retimers. The ADDR[1:0] pins can be left floating for an 8-bit SMBus slave address of 0x44. For the second DS250DF230, a single pullup or pulldown resistor can be used on one address pin. For example, with ADDR0 = Float and ADDR1 = 1 k Ω to GND, the 8-bit SMBus slave address will be 0x34.

4. Determine if the device will be configured from EEPROM (SMBus Master Mode) or from the system I2C bus (SMBus Slave Mode).
 - a. If SMBus Master Mode will be used, provisions must be made for an EEPROM on the board with 8-bit SMBus address 0xA0. Refer to [SMBus Master Mode](#) for more details on SMBus Master Mode including EEPROM size requirements.
 - b. If SMBus Slave Mode will be used for all device configurations, for example when one or more of the retimers is configured with a microcontroller, an EEPROM is not needed.
5. Make provisions in the schematic and layout for standard decoupling capacitors between the device VDD supply and GND. Refer to the pin function description in [Pin Configuration and Functions](#) for more details.
6. Make provisions in the schematic and layout for a 30.72-MHz (± 100 ppm) or 25-MHz (± 100 ppm) single-ended CMOS clock. The DS250DF230 retimer buffers the clock on the CAL_CLK_IN pin and presents the buffered clock on the CAL_CLK_OUT pin. When using two Retimers on a paddle card, only one 30.72-MHz or 25-MHz clock is required. The CAL_CLK_OUT pin of one retimer can be connected to the CAL_CLK_IN pin of the other retimer.
7. Connect the INT_N open-drain output to the paddle card MCU if interrupt monitoring is desired, otherwise leave it floating. Note that multiple retimers' INT_N outputs can be connected together because this is an open-drain output. The common INT_N net should be pulled high.
8. If the application requires initial CDR lock acquisition at the ambient temperature extremes defined in [Recommended Operating Conditions](#), take care to ensure the operating junction temperature is met as well as the CDR stay-in-lock junction temperature range defined in [Electrical Characteristics](#). For example, if initial CDR lock acquisition occurs at a junction temperature of 110°C, then maintaining CDR lock would require the junction temperature on DS250DF230 to be kept above (110°C – TEMP_{LOCK-}).

9.2.2.3 Application Curves

See [Application Curves](#) in section [Front-Port Jitter Cleaning Applications](#).

9.2.3 Backplane and Mid-Plane Applications

The DS250DF230 has strong equalization capabilities that allow it to recover data over channels up to 35-dB insertion loss. As a result, the optimum placement for the DS250DF230 in a backplane/mid-plane application is with the higher-loss channel segment at the input and the lower-loss channel segment at the output. This reduces the equalization burden on the downstream ASIC/FPGA, as the DS250DF230 is equalizing a majority of the overall channel. This type of asymmetric placement is not a requirement, but when an asymmetric placement is required due to the presence of a passive backplane or mid-plane, then this becomes the recommended placement.

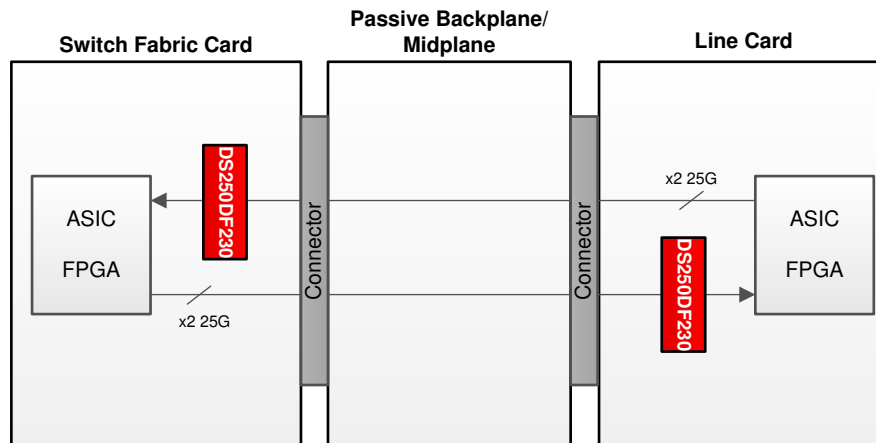

Figure 9-10. Backplane/Mid-Plane Application Block Diagram

Figure 9-11. Backplane/Mid-Plane Application Schematic

9.2.3.1 Design Requirements

For this design example, the following guidelines outlined in [Table 9-4](#) apply.

Table 9-4. Backplane/Mid-Plane Application Design Guidelines

DESIGN PARAMETER	REQUIREMENT
AC coupling capacitors	AC-coupling capacitors in the range of 100 to 220 nF are required for the RX inputs and TX outputs.
Input channel insertion loss	≤ 35 dB at 25.78125-Gbps Nyquist frequency (12.9 GHz)
Output channel insertion loss	Depends on downstream ASIC / FPGA capabilities. The DS250DF230 has a low-jitter output driver with 3-tap FIR filter for equalizing a portion of the output channel.
Link partner TX launch amplitude	800 mVppd to 1200 mVppd
Link partner TX FIR filter	Depends on channel loss. Refer to the Setting the Output V_{OD}, Pre-Cursor, and Post-Cursor Equalization section.

9.2.3.2 Detailed Design Procedure

The design procedure for backplane/mid-plane applications is as follows:

- Determine the total number of channels on the board which require a DS250DF230 for signal conditioning. This will dictate the total number of DS250DF230 devices required for the board. It is generally recommended that channels with similar total insertion loss on the board be grouped together in the same DS250DF230 device. This will simplify the device settings, as similar loss channels generally use similar settings.
- Determine the maximum current draw required for all DS250DF230 retimers. This may impact the selection of the regulator for the 2.5-V supply rail. To calculate the maximum current draw, multiply the maximum transient power supply current by the total number of DS250DF230 devices.
- Determine the maximum operational power consumption for the purpose of thermal analysis. There are two ways to approach this calculation:
 - Maximum mission-mode operational power consumption is when all channels are locked and re-transmitting the data which is received. PRBS pattern checkers/generators are not used in this mode because normal traffic cannot be checked with a PRBS checker. For this calculation, multiply the worst-case power consumption in mission mode by the total number of DS250DF230 devices.
 - Maximum debug-mode operational power consumption is when all channels are locked and re-transmitting the data which is received. At the same time, some channels' PRBS checkers or generators may be enabled. For this calculation, multiply the worst-case power consumption in debug mode by the total number of DS250DF230 devices.
- Determine the SMBus address scheme needed to uniquely address each DS250DF230 device on the board, depending on the total number of devices identified in step 2. Each DS250DF230 can be strapped with one of 16 unique SMBus addresses. If there are more DS250DF230 devices on the board than the number of unique SMBus addresses which can be assigned, then use an I2C expander like the **TCA/PCA family of I2C/SMBus switches and multiplexers** to split up the SMBus into multiple busses.
- Determine if the device will be configured from EEPROM (SMBus Master Mode) or from the system I2C bus (SMBus Slave Mode).
 - If SMBus Master Mode will be used, provisions must be made for an EEPROM on the board with 8-bit SMBus address 0xA0. Refer to [SMBus Master Mode](#) for more details on SMBus Master Mode including EEPROM size requirements.
 - If SMBus Slave Mode will be used for all device configurations, an EEPROM is not needed.
- Make provisions in the schematic and layout for standard decoupling capacitors between the device VDD supply and GND. Refer to the pin function description in [Pin Configuration and Functions](#) for more details.

7. Make provisions in the schematic and layout for a 30.72-MHz (± 100 ppm) or 25-MHz (± 100 ppm) single-ended CMOS clock. Each DS250DF230 retimer buffers the clock on the CAL_CLK_IN pin and presents the buffered clock on the CAL_CLK_OUT pin. This allows multiple (up to 20) retimers' calibration clocks to be daisy chained to avoid the need for multiple oscillators on the board. If the oscillator used on the board has a 2.5-V CMOS output, then no AC-coupling capacitor or resistor ladder is required at the input to CAL_CLK_IN. No AC coupling or resistor ladder is needed between one retimer's CAL_CLK_OUT output and the next retimer's CAL_CLK_IN input. The final retimer's CAL_CLK_OUT output can be left floating.
8. Connect the INT_N open-drain output to an FPGA or CPU if interrupt monitoring is desired. Note that multiple retimers' INT_N outputs can be connected together because this is an open-drain output. The common INT_N net must be pulled high.
9. If the application requires initial CDR lock acquisition at the ambient temperature extremes defined in [Recommended Operating Conditions](#), take care to ensure the operating junction temperature is met as well as the CDR stay-in-lock junction temperature range defined in [Electrical Characteristics](#). For example, if initial CDR lock acquisition occurs at a junction temperature of 110 °C, then maintaining CDR lock would require the junction temperature on DS250DF230 to be kept above (110°C - TEMP_{LOCK}).

9.2.3.3 Application Curves

See [Application Curves](#) in section [Front-Port Jitter Cleaning Applications](#).

10 Power Supply Recommendations

Follow these general guidelines when designing the power supply:

1. The power supply must be designed to provide the recommended operating conditions outlined in [Specifications](#) in terms of DC voltage, AC noise, and start-up ramp time.
2. The maximum current draw for the DS250DF230 is provided in [Specifications](#). This figure can be used to calculate the maximum current the power supply must provide. Typical mission-mode current draw can be inferred from the typical power consumption in [Specifications](#).
3. The DS250DF230 does not require any special power supply filtering (that is, ferrite bead), provided the recommended operating conditions are met. Only standard supply decoupling is required. Refer to the [Pin Configuration and Functions](#) section for details concerning the recommended supply decoupling.

11 Layout

11.1 Layout Guidelines

Follow these guidelines when designing the layout:

1. Decoupling capacitors must be placed as close to the VDD pins as possible. Placing them directly underneath the device is one option if the board design permits.
2. High-speed differential signals TXnP/TXnN and RXnP/RXnN must be tightly coupled, skew matched, and impedance controlled.
3. Vias must be avoided when possible on the high-speed differential signals. When vias must be used, take care to minimize the via stub, either by transitioning through most or all layers, or by back drilling.
4. GND relief can be used beneath the high-speed differential signal pads to improve signal integrity by counteracting the pad capacitance.
5. GND relief can be used beneath the AC-coupling capacitor pads to improve signal integrity by counteracting the pad capacitance.
6. GND vias must be placed directly beneath the device connecting the GND plane attached to the device to the GND planes on other layers. This has the added benefit of improving thermal conductivity from the device to the board.
7. If vias are used for the high-speed signals, the ground via must be implemented adjacent to the signal via to provide return path and isolation. For differential pair, the typical via configuration is *ground-signal-signal-ground*.

11.2 Layout Examples

The example layouts in [Figure 11-1](#) through [Figure 11-5](#) demonstrate how all signals can be escaped from the BGA array using microstrip routing on a generic multi-layer stackup.

13 Electrostatic Discharge Caution

This integrated circuit can be damaged by ESD. Texas Instruments recommends that all integrated circuits be handled with appropriate precautions. Failure to observe proper handling and installation procedures can cause damage.

ESD damage can range from subtle performance degradation to complete device failure. Precision integrated circuits may be more susceptible to damage because very small parametric changes could cause the device not to meet its published specifications.

DS250DF230ZLST	ACTIVE	NFBGA	ZLS	36	250	RoHS & Green	SNAGCU	Level-3-260C-168 HR	-40 to 85	D250DF230	Samples

(1) The marketing status values are defined as follows:

ACTIVE: Product device recommended for new designs.

LIFEBUY: TI has announced that the device will be discontinued, and a lifetime-buy period is in effect.

NRND: Not recommended for new designs. Device is in production to support existing customers, but TI does not recommend using this part in a new design.

PREVIEW: Device has been announced but is not in production. Samples may or may not be available.

OBSOLETE: TI has discontinued the production of the device.

(2) **RoHS:** TI defines "RoHS" to mean semiconductor products that are compliant with the current EU RoHS requirements for all 10 RoHS substances, including the requirement that RoHS substance do not exceed 0.1% by weight in homogeneous materials. Where designed to be soldered at high temperatures, "RoHS" products are suitable for use in specified lead-free processes. TI may reference these types of products as "Pb-Free".

RoHS Exempt: TI defines "RoHS Exempt" to mean products that contain lead but are compliant with EU RoHS pursuant to a specific EU RoHS exemption.

Green: TI defines "Green" to mean the content of Chlorine (Cl) and Bromine (Br) based flame retardants meet JS709B low halogen requirements of <=1000ppm threshold. Antimony trioxide based flame retardants must also meet the <=1000ppm threshold requirement.

(3) MSL, Peak Temp. - The Moisture Sensitivity Level rating according to the JEDEC industry standard classifications, and peak solder temperature.

(4) There may be additional marking, which relates to the logo, the lot trace code information, or the environmental category on the device.

(5) Multiple Device Markings will be inside parentheses. Only one Device Marking contained in parentheses and separated by a "~" will appear on a device. If a line is indented then it is a continuation of the previous line and the two combined represent the entire Device Marking for that device.

(6) Lead finish/Ball material - Orderable Devices may have multiple material finish options. Finish options are separated by a vertical ruled line. Lead finish/Ball material values may wrap to two lines if the finish value exceeds the maximum column width.

Important Information and Disclaimer: The information provided on this page represents TI's knowledge and belief as of the date that it is provided. TI bases its knowledge and belief on information provided by third parties, and makes no representation or warranty as to the accuracy of such information. Efforts are underway to better integrate information from third parties. TI has taken and

continues to take reasonable steps to provide representative and accurate information but may not have conducted destructive testing or chemical analysis on incoming materials and chemicals. TI and TI suppliers consider certain information to be proprietary, and thus CAS numbers and other limited information may not be available for release.

In no event shall TI's liability arising out of such information exceed the total purchase price of the TI part(s) at issue in this document sold by TI to Customer on an annual basis.

TAPE AND REEL INFORMATION

QUADRANT ASSIGNMENTS FOR PIN 1 ORIENTATION IN TAPE

*All dimensions are nominal

Device	Package Type	Package Drawing	Pins	SPQ	Reel Diameter (mm)	Reel Width W1 (mm)	A0 (mm)	B0 (mm)	K0 (mm)	P1 (mm)	W (mm)	Pin1 Quadrant

RTV0032E

PACKAGE OUTLINE

WQFN - 0.8 mm max height

PLASTIC QUAD FLATPACK - NO LEAD

4225196/A 08/2019

NOTES:

1. All linear dimensions are in millimeters. Any dimensions in parenthesis are for reference only. Dimensioning and tolerancing per ASME Y14.5M.
2. This drawing is subject to change without notice.
3. The package thermal pad must be soldered to the printed circuit board for thermal and mechanical performance.

EXAMPLE BOARD LAYOUT

RTV0032E

WQFN - 0.8 mm max height

PLASTIC QUAD FLATPACK - NO LEAD

LAND PATTERN EXAMPLE
SCALE:18X

SOLDER MASK DETAILS

4225196/A 08/2019

NOTES: (continued)

4. This package is designed to be soldered to a thermal pad on the board. For more information, see Texas Instruments literature number SLUA271 (www.ti.com/lit/slua271).
5. Vias are optional depending on application, refer to device data sheet. If any vias are implemented, refer to their locations shown on this view. It is recommended that vias under paste be filled, plugged or tented.

EXAMPLE STENCIL DESIGN

RTV0032E

WQFN - 0.8 mm max height

PLASTIC QUAD FLATPACK - NO LEAD

SOLDER PASTE EXAMPLE
 BASED ON 0.125 mm THICK STENCIL

EXPOSED PAD 33:
 75% PRINTED SOLDER COVERAGE BY AREA UNDER PACKAGE
 SCALE:20X

4225196/A 08/2019

NOTES: (continued)

6. Laser cutting apertures with trapezoidal walls and rounded corners may offer better paste release. IPC-7525 may have alternate design recommendations.

4220412/A 04/2017

NOTES:

1. All linear dimensions are in millimeters. Any dimensions in parenthesis are for reference only. Dimensioning and tolerancing per ASME Y14.5M.
2. This drawing is subject to change without notice.

EXAMPLE BOARD LAYOUT
