SLLS666F - SEPTEMBER 2005 - REVISED MARCH 2023

# SN65HVD5x High Output Full-Duplex RS-485 Drivers and Receivers

### 1 Features

- 1/8 Unit-load option available (up to 256 nodes on the bus)
- Bus-pin ESD protection exceeds 15 kV HBM
- Optional driver output transition times for signaling rates<sup>(1)</sup> of 1 Mbps, 5 Mbps and 25 Mbps
- Low-current standby mode < 1 µA
- Glitch-free power-up and power-down bus I/Os
- Bus idle, open, and short circuit failsafe
- Designed for RS-422 and RS485 networks
- 3.3-V Devices available, SN65HVD30-35 1

## 2 Applications

- Utility meters
- Chassis-to-chassis interconnects
- DTE/DCE Interfaces
- Industrial, process, and building automation
- Point-of-sale (POS) terminals and networks

### 3 Description

The SN65HVD5X devices are 3-state differential line drivers and differential-input line receivers that operate with a 5-V power supply. Each driver and receiver has separate input and output pins for full-duplex bus communication designs. They are designed for balanced transmission lines and interoperation with ANSI TIA/EIA-485A, TIA/EIA-422-B, ITU-T v.11 and ISO 8482:1993 standard-compliant devices.

The SN65HVD50, SN65HVD51, and SN65HVD52 are fully enabled with no external enabling pins.

The SN65HVD53, SN65HVD54, and SN65HVD55 have active-high driver enables and active-low receiver enables. A low, less than 1 µA, standby current is achieved by disabling both the driver and receiver.

All devices are characterized for operation from -40°C to 85°C.

The high output feature of the SN65HVD5x provides more noise margin than the typical RS-485 drivers. The extra noise margin makes applications in long cable and harsh noise environments possible.

#### Differential Output Voltage |Vop|

<sup>1</sup> The signaling rate of a line is the number of voltage transitions that are made per second expressed in the units bps (bits per second).

## 7 Specifications

### 7.1 Absolute Maximum Ratings

over operating free-air temperature range (unless otherwise noted)(1) (2)

		UNIT
V <sub>CC</sub>	Supply voltage range	–0.3 V to 6 V
$V_{(A)}, V_{(B)}, V_{(Y)}, V_{(Z)}$	Voltage range at any bus terminal (A, B, Y, Z)	–9 V to 14 V
V <sub>(TRANS)</sub>	Voltage input, transient pulse through 100 Ω. See Figure 8-12 (A, B, Y, Z) <sup>(3)</sup>	–50 to 50 V
VI	Voltage input range (D, DE, RE)	-0.5 V to 7 V
P <sub>D(cont)</sub>	Continuous total power dissipation	Internally limited <sup>(4)</sup>
Io	Output current (receiver output only, R)	11 mA

- (1) Stresses beyond those listed under absolute maximum ratings may cause permanent damage to the device. These are stress ratings only, and functional operation of the device at these or any other conditions beyond those indicated under recommended operating conditions is not implied. Exposure to absolute-maximum-rated conditions for extended periods may affect device reliability.
- 2) All voltage values, except differential I/O bus voltages, are with respect to network ground terminal.
- (3) This tests survivability only and the output state of the receiver is not specified.
- (4) The thermal shutdown typically occurs when the junction temperature reaches 165°C.

### 7.2 Recommended Operating Conditions

over operating free-air temperature range (unless otherwise noted)

				MIN	NOM	MAX	UNIT
V <sub>CC</sub>	Supply voltage			4.5		5.5	V
V <sub>I</sub> or V <sub>IC</sub>	Voltage at any b	ous terminal (se	eparately or common mode)	-7 <sup>(1)</sup>		12	V
		SN65HVD50	, SN65HVD53			25	
1/t <sub>UI</sub>	Signaling rate	SN65HVD5	, SN65HVD54			5	Mbps
		SN65HVD52	2, SN65HVD55			1	
$R_L$	Differential load	resistance		54	60		Ω
V <sub>IH</sub>	High-level input	voltage	D, DE, RE	2		V <sub>CC</sub>	
V <sub>IL</sub>	Low-level input	voltage	D, DE, RE	0		0.8	V
V <sub>ID</sub>	Differential inpu	t voltage		-12		12	
	High lavel system	.4	Driver	-60			^
Іон	High-level output current		Receiver	-8			mA
		4	Driver			60	^
I <sub>OL</sub>	Low-level output current		Receiver			8	mA
T <sub>J</sub> <sup>(2)</sup>	Junction temper	ature		-40		150	°C

- (1) The algebraic convention, in which the least positive (most negative) limit is designated as minimum is used in this data sheet.
- (2) See thermal characteristics table for information regarding this specification.

### 7.3 Electrostatic Discharge Protection

PARAMETER	TEST CONDITIONS	MIN	TYP <sup>(1)</sup>	MAX	UNIT
Human body model	Bus terminals and GND		±16		
Human body model <sup>(2)</sup>	All pins		±4		kV
Charged-device-model <sup>(3)</sup>	All pins		±1		

- All typical values at 25°C and with a 5-V supply.
- (2) Tested in accordance with JEDEC Standard 22, Test Method A114-A.
- (3) Tested in accordance with JEDEC Standard 22, Test Method C101.

### 7.4 Driver Electrical Characteristics

	PARAMETER		TEST CO	NDITIONS	MIN	TYP <sup>(1)</sup>	MAX	UNIT	
V <sub>I(K)</sub>	Input clamp voltage		I <sub>I</sub> = -18 mA		-1.5				
			I <sub>O</sub> = 0		4		V <sub>CC</sub>		
D.7	Ot a december differential		$R_L$ = 54 Ω, See Figu	ure 8-1 (RS-485)	1.7	2.6			
$ V_{OD(SS)} $	Steady-state differential	output voitage	$R_L = 100 \Omega$ , See Fig	gure 8-1 (RS-422)	2.4	3.2			
			$V_{\text{test}} = -7 \text{ V to } 12 \text{ V},$	See Figure 8-2	1.6				
$\Delta  V_{OD(SS)} $	Change in magnitude of differential output voltage		$R_L = 54 \Omega$ , See Figu. 8-2	ure 8-1 and Figure	-0.2		0.2		
V <sub>OD(RING)</sub>	Differential Output Voltaç and undershoot	e overshoot	$R_L = 54 \Omega$ , $C_L = 50 \Omega$ See Figure 8-3 for d				10% <sup>(2)</sup>	V	
	Peak-to-peak	HVD50, HVD53				0.5			
$V_{OC(PP)}$	common-mode	HVD51, HVD54	See Figure 8-4			0.4			
	output voltage	HVD52, HVD55				0.4			
V <sub>OC(SS)</sub>	Steady-state common-m output voltage	teady-state common-mode utput voltage					3.3		
$\Delta V_{OC(SS)}$	Change in steady-state o	common-mode output	See Figure 8-4		-0.1		0.1		
		HVD50, HVD51, HVD52	V <sub>CC</sub> = 0 V, V <sub>Z</sub> or V <sub>Y</sub> Other input at 0 V	= 12 V,			90		
			HVD52	V	V <sub>CC</sub> = 0 V, V <sub>Z</sub> or V <sub>Y</sub> Other input at 0 V	= -7 V,	-10		
$I_{Z(Z)}$ or $I_{Y(Z)}$	High-impedance state output current	HVD53, HVD54,	$V_{CC} = 5 \text{ V or } 0 \text{ V},$ DE = 0  V $V_Z \text{ or } V_Y = 12 \text{ V}$	Other input			90	μΑ	
		HVD55	$V_{CC} = 5 \text{ V or } 0 \text{ V},$ $DE = 0 \text{ V}$ $V_Z \text{ or } V_Y = -7 \text{ V}$	at 0 V	-10				
11	01	+(3)	$V_Z$ or $V_Y = -7$ V Other input at 0 V		-250		250	4	
$I_{Z(S)}$ or $I_{Y(S)}$	Short-circuit output curre	nt(~)			-250		250	mA	
I <sub>I</sub>	Input current	D, DE			0		100	μA	
C <sub>(OD)</sub>	Differential output capac	tance	V <sub>OD</sub> = 0.4 sin (4E6π DE at 0 V	rt) + 0.5 V,		16		pF	

<sup>1)</sup> All typical values are at 25°C and with a 5-V supply.

<sup>(2) 10%</sup> of the peak-to-peak differential output voltage swing, per TIA/EIA-485

<sup>(3)</sup> Under some conditions of short-circuit to negative voltages, output currents exceeding the ANSI TIA/EIA-485-A maximum current of 250 mA may occur. Continuous exposure may affect device reliability.

## 7.5 Driver Switching Characteristics

	PARAM	ETER	TEST CONDITIONS	MIN	TYP <sup>(1)</sup>	MAX	UNIT	
		HVD50, HVD53		4	8	12		
t <sub>PLH</sub>	Propagation delay time, low-to-high-level output	HVD51, HVD54		20	29	46	ns

t <sub>PHL</sub>	Propagation delay time, high-to-low-level output	HVD51, HVD54		20	30	46		
	riigri-to-low-level output	HVD52, HVD55		90	143	230		
		HVD50, HVD53		3	6	12		
t <sub>r</sub>	Differential output signal rise time	HVD51, HVD54		20	34	60	ns	
	umo	HVD52, HVD55 $R_1 = 54 \Omega$ , $C_1 = 50 pF$ .	$R_L = 54 \Omega, C_L = 50 pF,$	120	197	300		
		HVD50, HVD53	See Figure 8-5	3	6	11		
t <sub>f</sub>	Differential output signal fall time	HVD51, HVD54		20	33	60	ns	
	unic	HVD52, HVD55		120	192	300		
		HVD50, HVD53			1.4			
t <sub>sk(p)</sub>	Pulse skew ( t <sub>PHL</sub> - t <sub>PLH</sub>  )	HVD51, HVD54			1.6		ns	
		HVD52, HVD55			7.4			
		HVD50, HVD53		1				
t <sub>sk(pp)</sub> (2)	Part-to-part skew	HVD51, HVD54			4		ns	
		HVD52, HVD55			22			
	Propagation delay	HVD53				30		
t <sub>PZH1</sub>	time, high-impedance-to-	HVD54	$R_L = 110 \Omega$ , $\overline{RE}$ at 0 V,			180	4	
	high-level output	HVD55	See Figure 8-6			380		
	Propagation delay	HVD53	D = 3 V and S1 = Y,	D = 3 V and S1 = Y,		16		
t <sub>PHZ</sub>	time, high-level-to-high-	HVD54	D = 0 V and S1 = Z			40	ns	
	impedance output	HVD55				110		
	Propagation delay time,	HVD53				23		
t <sub>PZL1</sub>	high-impedance-to-low-level	HVD54	P = 110 O PE at 0 V			200	ns	
	output	HVD55	See Figure 8-7	L = 110 Ω, RE at 0 V, ee Figure 8-7		420		
	Propagation delay time,	HVD53	D = 3 V and S1 = Z,			19		
$t_{PLZ}$	low-level-to-high-impedance	HVD54	D = 0 V and S1 = Y			70	ns	
	output	HVD55				160		
t <sub>PZH2</sub>	Propagation delay time, stand	$R_L$ = 110 $\Omega$ , $\overline{RE}$ at 3 V, See Figure 8-6 D = 3 V and S1 = Y, D = 0 V and S1 = Z			3300	ns		
t <sub>PZL2</sub>	Propagation delay time, stand	dby-to-low-level output	$R_L = 110 \Omega$ , $\overline{RE}$ at 3 V, See Figure 8-7 D = 3 V and S1 = Z, D = 0 V and S1 = Y			3300	ns	

<sup>(1)</sup> All typical values are at 25°C and with a 5-V supply.

<sup>(2)</sup>  $t_{sk(pp)}$  is the magnitude of the difference in propagation delay times between any specified terminals of two devices when both devices operate with the same supply voltages, at the same temperature, and have identical packages and test circuits.

### 7.6 Receiver Electrical Characteristics

PARAMETER		TEST CONDITIONS		MIN	TYP <sup>(1)</sup>	MAX	UNIT		
V <sub>IT+</sub>	Positive-going differ threshold voltage	ential input	I <sub>O</sub> = -8 mA				-0.02	V

### 9 Device Information

## 9.1 LI-Power Standby Mode

When both the driver and receiver are disabled (DE low and  $\overline{RE}$  high) the device is in standby mode. If the enable inputs are in this state for less than 60 ns, the device does not enter standby mode. This guards against inadvertently entering standby mode during driver/receiver enabling. Only when the enable inputs are held in this state for 300 ns or more, the device is assured to be in standby mode. In this low-power standby mode, most internal circuitry is powered down, and the supply current is typically less than 1 nA. When either the driver or the receiver is re-enabled, the internal circuitry becomes active.

Figure 9-1. Low-Power Standby Logic Diagram

If only the driver is re-enabled (DE transitions to high) the driver outputs are driven according to the D input after the enable times given by  $t_{PZH2}$  and  $t_{PZL2}$  in the driver switching characteristics. If the D input is open when the driver is enabled, the driver outputs defaults to A high and B low, in accordance with the driver failsafe feature.

If only the receiver is re-enabled ( $\overline{RE}$  transitions to low) the receiver output is driven according to the state of the bus inputs (A and B) after the enable times given by  $t_{PZH2}$  and  $t_{PZL2}$  in the receiver switching characteristics. If there is no valid state on the bus the receiver responds as described in the failsafe operation section.

If both the receiver and driver are re-enabled simultaneously, the receiver output is driven according to the state of the bus inputs (A and B) and the driver output is driven according to the D input. Note that the state of the active driver affects the inputs to the receiver. Therefore, the receiver outputs are valid as soon as the driver outputs are valid.

## 10 Application and Implementation

#### Note

Information in the following applications sections is not part of the TI component specification, and TI does not warrant its accuracy or completeness. TI's customers are responsible for determining suitability of components for their purposes, as well as validating and testing their design implementation to confirm system functionality.

### 10.1 Thermal Characteristics of IC Packages

 $\theta_{JA}$  (Junction-to-Ambient Thermal Resistance) is defined as the difference in junction temperature to ambient temperature divided by the operating power.

 $\theta_{JA}$  is not a constant and is a strong function of:

- the PCB design (50% variation)
- altitude (20% variation)
- device power (5% variation)

 $\theta_{JA}$  can be used to compare the thermal performance of packages if the specific test conditions are defined and used. Standardized testing includes specification of PCB construction, test chamber volume, sensor locations, and the thermal characteristics of holding fixtures.  $\theta_{JA}$  is often misused when it is used to calculate junction temperatures for other installations.

TI uses two test PCBs as defined by JEDEC specifications. The low-k board gives *average* in-use condition thermal performance, and it consists of a single copper trace layer 25 mm long and 2-oz thick. The high-k board gives best *case* in-use condition, and it consists of two 1-oz buried power planes with a single copper trace layer 25 mm long and 2-oz thick. A 4% to 50% difference in  $\theta_{JA}$  can be measured between these two test cards

 $\theta_{JC}$  (Junction-to-Case Thermal Resistance) is defined as difference in junction temperature to case divided by the operating power. It is measured by putting the mounted package up against a copper block cold plate to force heat to flow from die, through the mold compound into the copper block.

 $\theta_{JC}$  is a useful thermal characteristic when a heatsink applied to package. It is *not* a useful characteristic to predict junction temperature because it provides pessimistic numbers if the case temperature is measured in a nonstandard system and junction temperatures are backed out. It can be used with  $\theta_{JB}$  in 1-dimensional thermal simulation of a package system.

 $\theta_{JB}$  (Junction-to-Board Thermal Resistance) is defined as the difference in the junction temperature and the PCB temperature at the center of the package (closest to the die) when the PCB is clamped in a cold-plate structure.  $\theta_{JB}$  is only defined for the high-k test card.

 $\theta_{JB}$  provides an overall thermal resistance between the die and the PCB. It includes a bit of the PCB thermal resistance (especially for BGA's with thermal balls) and can be used for simple 1-dimensional network analysis of package system, see Figure 10-1.

Figure 10-1. Thermal Resistance

## 11 Device and Documentation Support

## 11.1 Receiving Notification of Documentation Updates

To receive notification of documentation updates, navigate to the device product folder on ti.com. Click on *Subscribe to updates* to register and receive a weekly digest of any product information that has changed. For change details, review the revision history included in any revised document.

### 11.2 Support Resources

TI E2E<sup>™</sup> support forums are an engineer's go-to source for fast, verified answers and design help — straight from the experts. Search existing answers or ask your own question to get the quick design help you need.

Linked content is provided "AS IS" by the respective contributors. They do not constitute TI specifications and do not necessarily reflect TI's views; see TI's Terms of Use.

### 11.3 Trademarks

TI E2E™ is a trademark of Texas Instruments.

All trademarks are the property of their respective owners.

### 11.4 Electrostatic Discharge Caution

This integrated circuit can be damaged by ESD. Texas Instruments recommends that all integrated circuits be handled with appropriate precautions. Failure to observe proper handling and installation procedures can cause damage.

ESD damage can range from subtle performance degradation to complete device failure. Precision integrated circuits may be more susceptible to damage because very small parametric changes could cause the device not to meet its published specifications.

### 11.5 Glossary

TI Glossary

This glossary lists and explains terms, acronyms, and definitions.

## 12 Mechanical, Packaging, and Orderable Information

The following pages include mechanical, packaging, and orderable information. This information is the most current data available for the designated devices. This data is subject to change without notice and revision of this document. For browser-based versions of this data sheet, refer to the left-hand navigation.

<sup>(1)</sup> The marketing status values are defined as follows:

ACTIVE: Product device recommended for new designs.

LIFEBUY: TI has announced that the device will be discontinued, and a lifetime-buy period is in effect.

NRND: Not recommended for new designs. Device is in production to support existing customers, but TI does not recommend using this part in a new design.

PREVIEW: Device has been announced but is not in production. Samples may or may not be available.

**OBSOLETE:** TI has discontinued the production of the device.

RoHS Exempt: TI defines "RoHS Exempt" to mean products that contain lead but are compliant with EU RoHS pursuant to a specific EU RoHS exemption.

**Green:** TI defines "Green" to mean the content of Chlorine (CI) and Bromine (Br) based flame retardants meet JS709B low halogen requirements of <=1000ppm threshold. Antimony trioxide based flame retardants must also meet the <=1000ppm threshold requirement.

<sup>(2)</sup> **RoHS:** TI defines "RoHS" to mean semiconductor products that are compliant with the current EU RoHS requirements for all 10 RoHS substances, including the requirement that RoHS substance do not exceed 0.1% by weight in homogeneous materials. Where designed to be soldered at high temperatures, "RoHS" products are suitable for use in specified lead-free processes. TI may reference these types of products as "Pb-Free".

<sup>(3)</sup> MSL, Peak Temp. - The Moisture Sensitivity Level rating according to the JEDEC industry standard classifications, and peak solder temperature.

## **PACKAGE OPTION ADDENDUM**

www.ti.com 17-Jun-2023

- (4) There may be additional marking, which relates to the logo, the lot trace code information, or the environmental category on the device.
- (5) Multiple Device Markings will be inside parentheses. Only one Device Marking contained in parentheses and separated by a "~" will appear on a device. If a line is indented then it is a continuation of the previous line and the two combined represent the entire Device Marking for that device.
- (6) Lead finish/Ball material Orderable Devices may have multiple material finish options. Finish options are separated by a vertical ruled line. Lead finish/Ball material values may wrap to two lines if the finish value exceeds the maximum column width.

**Important Information and Disclaimer:** The information provided on this page represents TI's knowledge and belief as of the date that it is provided. TI bases its knowledge and belief on information provided by third parties, and makes no representation or warranty as to the accuracy of such information. Efforts are underway to better integrate information from third parties. TI has taken and continues to take reasonable steps to provide representative and accurate information but may not have conducted destructive testing or chemical analysis on incoming materials and chemicals. TI and TI suppliers consider certain information to be proprietary, and thus CAS numbers and other limited information may not be available for release.

In no event shall TI's liability arising out of such information exceed the total purchase price of the TI part(s) at issue in this document sold by TI to Customer on an annual basis.

## PLASTIC SMALL OUTLINE

NOTES:

- A. All linear dimensions are in inches (millimeters).
- B. This drawing is subject to change without notice.
- Body length does not include mold flash, protrusions, or gate burrs. Mold flash, protrusions, or gate burrs shall not exceed 0.006 (0,15) each side.
- Body width does not include interlead flash. Interlead flash shall not exceed 0.017 (0,43) each side.
- E. Reference JEDEC MS-012 variation AB.

SMALL OUTLINE INTEGRATED CIRCUIT

### NOTES:

- 1. Linear dimensions are in inches [millimeters]. Dimensions in parenthesis are for reference only. Controlling dimensions are in inches. Dimensioning and tolerancing per ASME Y14.5M.
- 2. This drawing is subject to change without notice.
- 3. This dimension does not include mold flash, protrusions, or gate burrs. Mold flash, protrusions, or gate burrs shall not exceed .006 [0.15] per side.
- 4. This dimension does not include interlead flash.
- 5. Reference JEDEC registration MS-012, variation AA.

SMALL OUTLINE INTEGRATED CIRCUIT

NOTES: (continued)

6. Publication IPC-7351 may have alternate designs.

7. Solder mask tolerances between and around signal pads can vary based on board fabrication site.

SMALL OUTLINE INTEGRATED CIRCUIT

### NOTES: (continued)

- 8. Laser cutting apertures with trapezoidal walls and rounded corners may offer better paste release. IPC-7525 may have alternate design recommendations.
- 9. Board assembly site may have different recommendations for stencil design.

These resources are intended for skilled developers designing with TI products. You are solely responsible for (1) selecting the appropriate TI products for your application, (2) designing, validating and testing your application, and (3) ensuring your application meets applicable standards, and any other safety, security, regulatory or other requirements.

These resources are subject to change without notice. TI grants you permission to use these resources only for development of an application that uses the TI products described in the resource. Other reproduction and display of these resources is prohibited. No license is granted to any other TI intellectual property right or to any third party intellectual property right. TI disclaims responsibility for, and you will fully indemnify TI and its representatives against, any claims, damages, costs, losses, and liabilities arising out of your use of these resources.

TI's products are provided subject to TI's Terms of Sale or other applicable terms available either on ti.com or provided in conjunction with such TI products. TI's provision of these resources does not expand or otherwise alter TI's applicable warranties or warranty disclaimers for TI products.

TI objects to and rejects any additional or different terms you may have proposed.
