

High Side Switch with Adjustable Current Limit and Diagnostic Features

ON Semiconductor®

www.onsemi.com

NCV47722

The NCV47722 High Side Switch (HSS) with 250 mA is designed for use in harsh automotive environments. The device has a high peak input voltage tolerance and reverse input voltage, reverse bias, overcurrent and overtemperature protections. The integrated current sense feature (adjustable by resistor connected to CSO pin) provides diagnosis and system protection functionality. The CSO pin output current creates voltage drop across CSO resistor which is proportional to output current. Extended diagnostic features in OFF state are also available and controlled by dedicated input and output pins.

Features

- Output Current: up to 250 mA
- Enable Input (3.3 V Logic Compatible)
- Adjustable Current Limit: up to 350 mA
- Protection Features:
 - ◆ Current Limitation
 - ◆ Thermal Shutdown
 - ◆ Reverse Input Voltage and Reverse Bias Voltage
- Diagnostic Features:
 - ◆ Short To Battery (STB) and Open Load (OL) in OFF State
 - ◆ Internal Components for OFF State Diagnostics
 - ◆ Open Collector Flag Output
 - ◆ Output Voltage Monitoring Output (analog)
- AEC-Q100 Grade 1 Qualified and PPAP Capable
- These Devices are Pb-Free, Halogen Free/BFR Free and are RoHS Compliant

Typical Applications

- Audio and Infotainment System
- Active Safety System

14	NC	Not Connected, not internally bonded.
EPAD	EPAD	Exposed Pad is connected to Ground. Connect to GND plane on PCB.

Table 2. MAXIMUM RATINGS

Rating	Symbol	Min	Max	Unit
Input Voltage DC	V_{in}	-42	45	V
Input Voltage (Note 1) Load Dump – Suppressed	U_{S*}	-	60	V
Enable Input Voltage	V_{EN}	-42	45	V
Output Voltage Monitoring	V_{out_FB}	-0.3	10	V
CSO Voltage	V_{CSO}	-0.3	7	V
DE, CS and EF Voltages	V_{DE}, V_{CS}, V_{EF}	-0.3	7	V
Output Voltage	V_{out}	-1	40	V
Junction Temperature	T_J	-40	150	°C
Storage Temperature	T_{STG}	-55	150	°C

Stresses exceeding those listed in the Maximum Ratings table may damage the device. If any of these limits are exceeded, device functionality should not be assumed, damage may occur and reliability may be affected.

1. Load Dump Test B (with centralized load dump suppression) according to ISO16750-2 standard. Guaranteed by design. Not tested in production. Passed Class A according to ISO16750-1.

Table 3. ESD CAPABILITY (Note 2)

Rating	Symbol	Min	Max	Unit
ESD Capability, Human Body Model	ESD_{HBM}	-2	2	kV

2. This device series incorporates ESD protection and is tested by the following methods:
 ESD Human Body Model tested per AEC-Q100-002 (JS-001-2010)
 Field Induced Charge Device Model ESD characterization is not performed on plastic molded packages with body sizes < 50 mm² due to the inability of a small package body to acquire and retain enough charge to meet the minimum CDM discharge current waveform characteristic defined in JEDEC JS-002-2014.

Table 4. LEAD SOLDERING TEMPERATURE AND MSL (Note 3)

Rating	Symbol	Min	Max	Unit
Moisture Sensitivity Level	MSL	1		-

DEFINITIONS

General

All measurements are performed using short pulse low duty cycle techniques to maintain junction temperature as close as possible to ambient temperature.

Input to Output Differential Voltage

The Input to Output Differential Voltage parameter is defined for specific output current values and specified over Temperature range.

Quiescent and Disable Currents

Quiescent Current (I_q) is the difference between the input current (measured through the LDO input pin) and the output load current. If Enable pin is set to LOW the regulator reduces its internal bias and shuts off the output, this term is called the disable current (I_{DIS}).

Current Limit

Current Limit is value of output current by which output voltage drops 1 V below input supply voltage level.

Thermal Protection

Internal thermal shutdown circuitry is provided to protect the integrated circuit in the event that the maximum junction temperature is exceeded. When activated at typically 175°C, the regulator turns off. This feature is provided to prevent failures from accidental overheating.

Maximum Package Power Dissipation

The power dissipation level is maximum allowed power dissipation for particular package or power dissipation at which the junction temperature reaches its maximum operating value, whichever is lower.

APPLICATIONS INFORMATION

Circuit Description

The NCV47722 is an integrated High Side Switch (HSS) with output current capability up to 250 mA to output. It is enabled with an input to the enable pin. The integrated current sense feature provides diagnosis and system protection functionality. The current limit of the device is adjustable by resistor connected to CSO pin. Voltage on CSO pin is proportional to output current. The HSS is protected by both current limit and thermal shutdown. Thermal shutdown occurs above 150°C to protect the IC during overloads and extreme ambient temperatures.

Enable Input

The enable pin is used to turn the regulator on or off. By holding the pin down to a voltage less than 0.99 V, the output of the regulator will be turned off. When the voltage on the enable pin is greater than 2.31 V, the output of the regulator will be enabled to power its output to the regulated output voltage. The enable pin may be connected directly to the input pin to give constant enable to the output regulator.

Setting the Output Current Limit

The output current limit can be set up to 350 mA by external resistor R_{CSO} (see Figure 1). Capacitor C_{CSO} of 1 μF in parallel with R_{CSO} is required for stability of current limit control circuitry (see Figure 1).

$$V_{CSO} = I_{out} \left(R_{CSO} \times \frac{1}{RATIO} \right) \quad (eq. 1)$$

$$I_{LIM} = RATIO \times \frac{2.55}{R_{CSO}} \quad (eq. 2)$$

$$R_{CSO} = RATIO \times \frac{2.55}{I_{LIM}} \quad (eq. 3)$$

where

- R_{CSO} – current limit setting resistor
- V_{CSO} - voltage at CSO pin proportional to I_{out}
- I_{LIM} – current limit value
- I_{out} – output current actual value
- RATIO – typical value of Output Current to CSO Current Ratio for particular output current range

CSO pin provides information about output current actual value. The CSO voltage is proportional to output current according to Equation 1.

Once output current reaches its limit value (I_{LIM}) set by external resistor R_{CSO} than voltage at CSO pin is typically 2.55 V. Calculations of I_{LIM} or R_{CSO} values can be done using Equation 2 and Equation 3, respectively. Minimum and maximum value of Output Current Limit can be calculated according to Equations 4 and 5.

$$I_{LIM_min} = RATIO_{min} \times \frac{V_{CSO_min}}{R_{CSO_max}} \quad (eq. 4)$$

$$I_{LIM_max} = RATIO_{max} \times \frac{V_{CSO_max}}{R_{CSO_min}} \quad (eq. 5)$$

where

RATIO_{min} – minimum value of Output Current to CSO Current Ratio from electrical characteristics table and particular output current range

RATIO_{max} – maximum value of Output Current to CSO Current Ratio from electrical characteristics table and particular output current range

V_{CSO_min} - minimum value of CSO Voltage Level at Current Limit from electrical characteristics table

V_{CSO_max} - maximum value of CSO Voltage Level at Current Limit from electrical characteristics table

R_{CSO_min} – minimum value of R_{CSO} with respect its accuracy

R_{CSO_max} – maximum value of R_{CSO} with respect its accuracy

Designers should consider the tolerance of R_{CSO} during the design phase.

Diagnostic in OFF State

The NCV47722 contains also circuitry for OFF state diagnostics for Short to Battery (STB) and Open Load (OL). There are internal current source and Pull Down resistors which provide additional cost savings for overall application by excluding external components and their assembly cost and saving PCB space and safe control IOs of a Microcontroller Unit (MCU).

Simplified functional schematic and truth table is shown in Figure 13 and related flowchart in Figure 14.

Figure 13. Simplified Functional Diagram of OFF State Diagnostics (STB and OL)

For diagnostics in OFF state the input DE pin has to be put logic high. Logic level on EN pin determines which failure (STB or OL) is diagnosed. For detailed information see Diagnostic Truth Table 7.

Diagnostic in ON State

Diagnostic in ON State provides information about Overcurrent or Short to Ground failures, during which the EF output is in logic low state. For detailed information see Diagnostic Features Truth Table 7.

Table 7. DIAGNOSTIC FEATURES TRUTH TABLE

Operational Status	EN	DE	Output Voltage (V _{out})	Diagnostic Output (CSO)	Error Flag (EF)
Disabled	L	L	Low (~0 V)	Low (~0 V)	HZ
Short to Battery	L	H	High (V _{out} ~ V _{in})	Low (~0 V)	L (Note 10)
Open Load (OFF)	H	H	High (V _{out} ~ V _{in})	Low (~0 V)	L (Note 11)
Normal (OFF)	H	H	Low (~0 V)	Low (~0 V)	HZ (Note 11)
Open Load (ON)	H	L	High (V _{out} ~ V _{in})	Low (~0 V)	HZ
Normal (ON)	H	L	High (V _{out} ~ V _{in})	Proportional to I _{out} (±5%) (Note 12)	HZ
Over Current	H	L	V _{in} - 1 V	High (~2.55 V)	L
Short to Ground	H	L	Low (~0 V)	High (~2.55 V)	L

10. Internal current source disabled (between V_{out} and V_{in}).

11. Internal current source enabled (between V_{out} and V_{in}).

12. Valid for I_{out} = 50 mA to 350 mA. For I_{out} = 10 mA to 50 mA range proportional to I_{out} (±15%).

Figure 14. Flowchart for Diagnostics in OFF State

Thermal Considerations

As power in the device increases, it might become necessary to provide some thermal relief. The maximum power dissipation supported by the device is dependent upon board design and layout. Mounting pad configuration on the PCB, the board material, and the ambient temperature affect the rate of junction temperature rise for the part. When the device has good thermal conductivity through the PCB, the junction temperature will be relatively low with high power applications. The maximum dissipation the device can handle is given by:

$$P_{D(MAX)} = \frac{[T_{J(MAX)} - T_A]}{R_{\theta JA}} \quad (\text{eq. 6})$$

Since T_J is not recommended to exceed 150°C , then the device soldered on 645 mm^2 , 1 oz copper area, FR4 can dissipate up to 2 W when the ambient temperature (T_A) is 25°C . See Figure 15 for $R_{\theta JA}$ versus PCB area. The power dissipated by the device can be calculated from the following equations:

$$P_D \approx V_{in}(I_q @ I_{out}) + I_{out}(V_{in} - V_{out}) \quad (\text{eq. 7})$$

or

$$V_{in(MAX)} \approx \frac{P_{D(MAX)} + (V_{out} \times I_{out})}{I_{out} + I_q} \quad (\text{eq. 8})$$

Figure 15. Thermal Resistance vs. PCB Copper Area

Hints

V_{in} and GND printed circuit board traces should be as wide as possible. When the impedance of these traces is high, there is a chance to pick up noise or cause the regulator to malfunction. Place external components, especially the output capacitor, as close as possible to the device and make traces as short as possible.
