Features

- AEC-Q100 qualified 
- ASIL B compliant if used in conjunction with a certified software library (ISO 26262:2018)
- Android Auto™ compliant and CarPlay® compliant
- Extended temperature range from -40 to +105 °C
- Embedded compensation for high stability over temperature
- Accelerometer user-selectable full scale up to ±16 g
- Extended gyroscope range from ±125 to ±4000 dps
- Dual operating modes: high-performance and low-power mode
- I²C, MIPI I3CSM, and SPI serial interfaces
- Six-channel synchronized output to enhance accuracy of dead-reckoning algorithms
- Programmable finite state machine
- Machine learning core
- Smart programmable interrupts
- Embedded 3 KB FIFO available to underload host processor
- **ECOPACK** and RoHS compliant

Applications

- Satellite precise positioning
- Vehicle-to-everything (V2X)
- ADAS systems
- Active suspension
- Radar, lidar, and camera digital stabilization
- Door/trunk modules
- Motion-activated functions

Description

The **ASM330LHB** is a 6-axis IMU that offers ASIL B compliance if used in conjunction with a certified software library and features a 3-axis digital accelerometer and a 3-axis digital gyroscope with an extended temperature range up to +105°C.

A safety manual and a software library, certified according to ISO 26262:2018, are provided to support the development of applications using the ASM330LHB and targeting ASIL B requirements.

ST's family of MEMS sensor modules leverages the robust and mature manufacturing processes already used for the production of micromachined accelerometers and gyroscopes to serve both the automotive and consumer market. The ASM330LHB is AEC-Q100 compliant and industrialized through a dedicated MEMS production flow to meet automotive reliability standards. All the parts are fully tested with respect to temperature to ensure the highest quality level.

The sensing elements are manufactured using ST's proprietary micromachining processes, while the IC interfaces are developed using CMOS technology that allows the design of a dedicated circuit, which is trimmed to better match the characteristics of the sensing element.

The ASM330LHB has a full-scale acceleration range of $\pm 2/\pm 4/\pm 8/\pm 16$ g and a wide angular rate range of $\pm 125/\pm 250/\pm 500/\pm 1000/\pm 2000/\pm 4000$ dps that enable its usage in a broad range of automotive applications.

The device supports dual operating modes: high-performance mode and low-power mode.

All the design aspects of the ASM330LHB have been optimized to reach superior output stability, extremely low noise, and full data synchronization to the benefit of sensor-assisted applications like dead reckoning and sensor fusion.

The ASM330LHB is available in a 14-lead plastic, land grid array (LGA) package.

1 Overview

The ASM330LHB is a system-in-package featuring a high-performance 3-axis digital accelerometer and 3-axis digital gyroscope.

This device is suitable for telematics and dead-reckoning applications as well as vehicle-to-vehicle (V2X) and impact detection as a result of its high stability over temperature and time, combined with superior sensing precision.

Supporting dual operating modes, the device has enhanced flexibility versus application requirements, leveraging on multiple voltage and multiple ODR selections. The device also includes digital features like a finite state machine and an ST proprietary machine learning core, allowing defined motion pattern detection or some complex algorithms run in the application processor to be moved to the MEMS sensor with the advantage of consistent reduction in power consumption.

The event-detection interrupts enable efficient and reliable motion-activated functions, implementing hardware recognition of free-fall events, 6D orientation, activity or inactivity, and wake-up events.

Like the entire portfolio of MEMS sensor modules, the ASM330LHB leverages the robust and mature in-house manufacturing processes already used for the production of micromachined accelerometers and gyroscopes. The various sensing elements are manufactured using specialized micromachining processes, while the IC interfaces are developed using CMOS technology that allows the design of a dedicated circuit, which is trimmed to better match the characteristics of the sensing element.

The ASM330LHB is available in a small plastic land grid array (LGA) package of 2.5 x 3.0 x 0.83 mm to address ultra-compact solutions.

This device, used in redundancy (as two modules) and in combination with a dedicated software library, has been evaluated as compatible to be adopted in ASIL B automotive applications. This solution is described in detail in application note AN5691.

2 Embedded low-power features

The ASM330LHB has been designed to feature the following on-chip functions:

- 3 KB data buffering
 - 100% efficiency with flexible configurations and partitioning
 - Possibility to store timestamp
- Event-detection interrupts (fully configurable)
 - Free-fall
 - Wake-up
 - 6D orientation
 - Activity/inactivity recognition
 - Stationary/motion detection
- Specific IP blocks with negligible power consumption and high performance
 - Finite state machine (FSM) for the accelerometer and gyroscope
 - Machine learning core (MLC) for the accelerometer and gyroscope

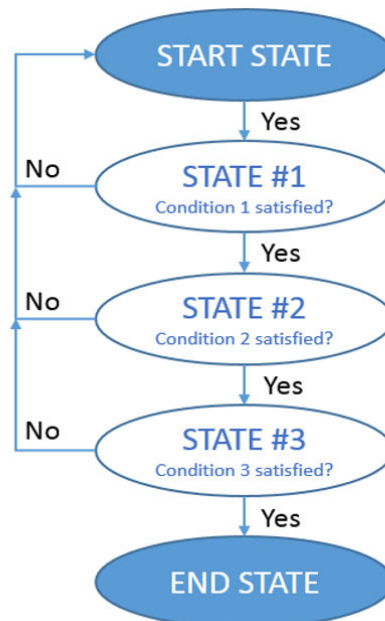

2.1 Finite state machine

The ASM330LHB can be configured to generate interrupt signals activated by user-defined motion patterns. To do this, up to 16 embedded finite state machines can be programmed independently for motion detection such as vehicle status (stationary or moving), anti-theft alarm and shock detection.

Definition of finite state machine

A state machine is a mathematical abstraction used to design logic connections. It is a behavioral model composed of a finite number of states and transitions between states, similar to a flow chart in which one can inspect the way logic runs when certain conditions are met. The state machine begins with a start state, goes to different states through transitions dependent on the inputs, and can finally end in a specific state (called stop state). The current state is determined by the past states of the system. The figure below shows a generic state machine.

Figure 1. Generic state machine

Finite state machine in the ASM330LHB

The ASM330LHB works as a combo accelerometer-gyroscope sensor, generating acceleration and angular rate output data. These data can be used as input of up to 16 programs in the embedded finite state machine (Figure 2. State machine in the ASM330LHB).

All 16 finite state machines are independent: each one has its dedicated memory area and it is independently executed. An interrupt is generated when the end state is reached or when some specific command is performed.

Figure 2. State machine in the ASM330LHB

2.2 Machine learning core

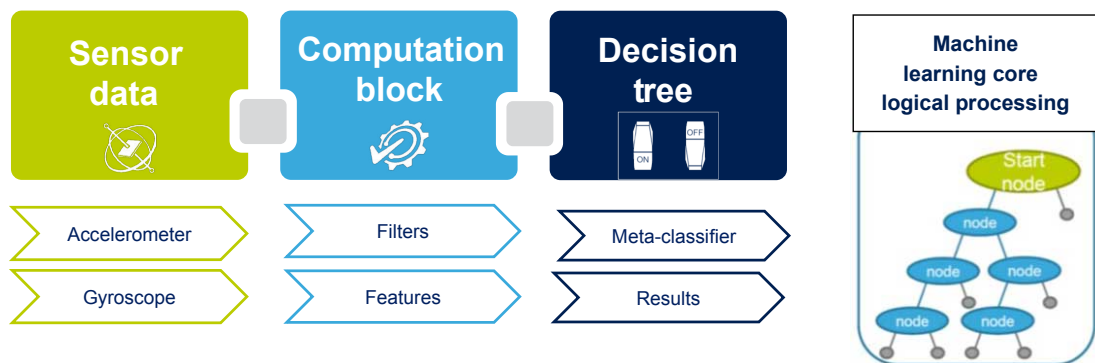

The ASM330LHB embeds a dedicated core for machine learning processing that provides system flexibility, allowing some algorithms run in the application processor to be moved to the MEMS sensor with the advantage of consistent reduction in power consumption.

Machine learning core logic allows identifying if a data pattern (for example motion, pressure, temperature, magnetic data, and so forth) matches a user-defined set of classes. Typical examples of applications could be activity detection like running, walking, driving, and so forth.

The ASM330LHB machine learning core works on data patterns coming from the accelerometer and gyroscope sensors. The input data can be filtered using a dedicated configurable computation block containing filters and features computed in a fixed time window defined by the user.

Machine learning processing is based on logical processing composed of a series of configurable nodes characterized by "if-then-else" conditions where the "feature" values are evaluated against defined thresholds.

Figure 3. Machine learning core in the ASM330LHB

The ASM330LHB can be configured to run up to 8 flows simultaneously and independently and every flow can generate up to 256 results. The total number of nodes can be up to 512.

The results of the machine learning processing are available in dedicated output registers readable from the application processor at any time.

The ASM330LHB machine learning core can be configured to generate an interrupt when a change in the result occurs.

1. Typical specifications are not guaranteed.
2. Values after factory calibration test and trimming at T = 25°C.
3. Long term includes the following conditions: post solder, drift in temperature in the range [-40°C to +105°C] and over life.
4. Max. values from design and characterization at ambient temperature (T = 25°C).
5. RMS noise is the same for all ODRs.
6. Noise density is the same for all ODRs.
7. Based on characterization data on a limited number of samples. Not measured during final test for production.
8. This ODR is available when the accelerometer is in low-power mode.
9. Accelerometer self-test limits are full-scale independent.
10. The sign of the linear acceleration self-test output change is defined by the STx_XL bits in a dedicated register for all axes.
11. The linear acceleration self-test output change is defined with the device in stationary condition as the absolute value of: OUTPUT[LSb] (self-test enabled) - OUTPUT[LSb] (self-test disabled). 1LSb = 0.061 mg at ±2 g full scale.

12. The angular rate self-test output change is defined with the device in stationary condition as the absolute value of: $OUTPUT[LSb]$ (self-test enabled) - $OUTPUT[LSb]$ (self-test disabled). 1LSb = 70 mdps at ± 2000 dps full scale.

13. The sign of the angular rate self-test output change is defined by the STx_G bits in a dedicated register for all axes.

4.5 Absolute maximum ratings

Stresses above those listed as “absolute maximum ratings” may cause permanent damage to the device. This is a stress rating only and functional operation of the device under these conditions is not implied. Exposure to maximum rating conditions for extended periods may affect device reliability.

Table 8. Absolute maximum ratings

Symbol	Ratings	Maximum value	Unit
Vdd	Supply voltage	-0.3 to 4.8	V
T _{STG}	Storage temperature range	-40 to +125	°C
Sg	Acceleration <i>g</i> for 0.3 ms	3000	<i>g</i>
ESD	Electrostatic discharge protection (HBM)	2	kV
V _{in}	Input voltage on any control pin (including CS, SCL/SPC, SDA/SDI/SDO, SDO/SA0)	-0.3 to Vdd_IO +0.3	V

Note: Supply voltage on any pin should never exceed 4.8 V.

This device is sensitive to mechanical shock, improper handling can cause permanent damage to the part.

This device is sensitive to electrostatic discharge (ESD), improper handling can cause permanent damage to the part.

4.6 Terminology

4.6.1 Sensitivity

Linear acceleration sensitivity can be determined, for example, by applying 1 g acceleration to the device. Because the sensor can measure DC accelerations, this can be done easily by pointing the selected axis towards the ground, noting the output value, rotating the sensor 180 degrees (pointing towards the sky) and noting the output value again. By doing so, ± 1 g acceleration is applied to the sensor. Subtracting the larger output value from the smaller one, and dividing the result by 2, leads to the actual sensitivity of the sensor. This value changes very little over temperature and over time. The sensitivity tolerance describes the range of sensitivities of a large number of sensors (see [Table 2](#)).

An angular rate gyroscope is a device that produces a positive-going digital output for counterclockwise rotation around the axis considered. Sensitivity describes the gain of the sensor and can be determined by applying a defined angular velocity to it. This value changes very little over temperature and time (see [Table 2](#)).

4.6.2 Zero-g and zero-rate level

Linear acceleration zero-g level offset (TyOff) describes the deviation of an actual output signal from the ideal output signal if no acceleration is present. A sensor in a steady state on a horizontal surface measures 0g on both the X-axis and Y-axis, whereas the Z-axis measures 1 g. Ideally, the output is in the middle of the dynamic range of the sensor (content of OUT registers 00h, data expressed as two's complement number). A deviation from the ideal value in this case is called zero-g offset.

Offset is to some extent a result of stress to the MEMS sensor and therefore the offset can slightly change after mounting the sensor onto a printed circuit board or exposing it to extensive mechanical stress. Offset changes little over temperature, see "Linear acceleration zero-g level change vs. temperature" in [Table 2](#). The zero-g level tolerance (TyOff) describes the standard deviation of the range of zero-g levels of a group of sensors.

Zero-rate level describes the actual output signal if there is no angular rate present. The zero-rate level of precise MEMS sensors is, to some extent, a result of stress to the sensor and therefore the zero-rate level can slightly change after mounting the sensor onto a printed circuit board or after exposing it to extensive mechanical stress. This value changes very little over temperature and time (see [Table 2](#)).

5 Digital interfaces

The ASM330LHB offers two communication protocols I²C / MIPI I³CSM slave interface or SPI (3- and 4-wire) serial interface.

Figure 7. Reference design - block diagram, I²C communication protocol

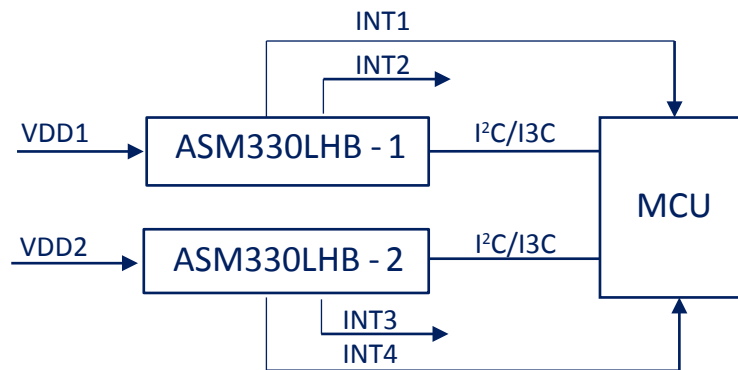

Figure 8. Reference design - block diagram, SPI4 communication protocol

5.1 I²C/SPI interface

The registers embedded inside the ASM330LHB may be accessed through both the I²C and SPI serial interfaces. The latter may be software-configured to operate either in 3-wire or 4-wire interface mode. The device is compatible with SPI modes 0 and 3.

The serial interfaces are mapped onto the same pins. To select/exploit the I²C interface, the CS line must be tied high (that is, connected to Vdd_IO).

Table 9. Serial interface pin description

Pin name	Pin description
CS	Enable SPI I ² C/SPI mode selection (1: SPI idle mode / I ² C communication enabled; 0: SPI communication mode / I ² C disabled)
SCL/SPC	I ² C serial clock (SCL) SPI serial port clock (SPC)
SDA/SDI/SDO	I ² C serial data (SDA) SPI serial data input (SDI) 3-wire interface serial data output (SDO)
SDO/SA0	SPI serial data output (SDO) I ² C less significant bit of the device address

5.1.1 I²C serial interface

The ASM330LHB I²C is a bus slave. The I²C is employed to write the data to the registers, whose content can also be read back.

The relevant I²C terminology is provided in the table below.

Table 10. I²C terminology

Term	Description
Transmitter	The device that sends data to the bus
Receiver	The device that receives data from the bus
Master	The device that initiates a transfer, generates clock signals, and terminates a transfer
Slave	The device addressed by the master

There are two signals associated with the I²C bus: the serial clock line (SCL) and the serial data line (SDA). The latter is a bidirectional line used for sending and receiving the data to/from the interface. Both the lines must be connected to Vdd_IO through external pull-up resistors. When the bus is free, both the lines are high.

The I²C interface is implemented with fast mode (400 kHz) I²C standards as well as with the standard mode.

In order to disable the I²C block, (I2C_disable) = 1 must be written in CTRL4_C (13h).

5.1.1.1 I²C operation

The transaction on the bus is started through a start (ST) signal. A start condition is defined as a high to low transition on the data line while the SCL line is held high. After this has been transmitted by the master, the bus is considered busy. The next byte of data transmitted after the start condition contains the address of the slave in the first 7 bits and the eighth bit tells whether the master is receiving data from the slave or transmitting data to the slave. When an address is sent, each device in the system compares the first seven bits after a start condition with its address. If they match, the device considers itself addressed by the master.

The slave address (SAD) associated to the ASM330LHB is 110101xb. The SDO/SA0 pin can be used to modify the less significant bit of the device address. If the SDO/SA0 pin is connected to the supply voltage, LSb is 1 (address 1101011b); else if the SDO/SA0 pin is connected to ground, the LSb value is 0 (address 1101010b). This solution permits to connect and address two different inertial modules to the same I²C bus.

Data transfer with acknowledge is mandatory. The transmitter must release the SDA line during the acknowledge pulse. The receiver must then pull the data line low so that it remains stable low during the high period of the acknowledge clock pulse. A receiver which has been addressed is obliged to generate an acknowledge after each byte of data received.

The I²C embedded inside the ASM330LHB behaves like a slave device and the following protocol must be adhered to. After the start condition (ST) a slave address is sent, once a slave acknowledge (SAK) has been returned, an 8-bit subaddress (SUB) is transmitted. The increment of the address is configured by CTRL3_C (12h) (IF_INC).

The slave address is completed with a read/write bit. If the bit is 1 (read), a repeated start (SR) condition must be issued after the two subaddress bytes; if the bit is 0 (write) the master transmits to the slave with direction unchanged. Table 11 explains how the SAD+read/write bit pattern is composed, listing all the possible configurations.

Table 11. SAD+read/write patterns

Command	SAD[6:1]	SAD[0] = SA0	R/W	SAD+R/W

Slave			SAK		SAK		SAK	DATA		DATA		DATA	

Data are transmitted in byte format (DATA). Each data transfer contains 8 bits. The number of bytes transferred per transfer is unlimited. Data is transferred with the most significant bit (MSb) first. If a slave receiver doesn't acknowledge the slave address (that is, it is not able to receive because it is performing some real-time function) the data line must be left high by the slave. The master can then abort the transfer. A low to high transition on the SDA line while the SCL line is high is defined as a stop condition. Each data transfer must be terminated by the generation of a stop (SP) condition.

In the presented communication format MAK is master acknowledge and NMAK is no master acknowledge.

5.1.2 SPI bus interface

The ASM330LHB SPI is a bus slave. The SPI allows writing to and reading from the registers of the device. The serial interface communicates to the application using 4 wires: **CS**, **SPC**, **SDI** and **SDO**.

Figure 9. Read and write protocol (in mode 3)

CS enables the serial port and it is controlled by the SPI master. It goes low at the start of the transmission and goes back high at the end. **SPC** is the serial port clock and it is controlled by the SPI master. It is stopped high when **CS** is high (no transmission). **SDI** and **SDO** are, respectively, the serial port data input and output. Those lines are driven at the falling edge of **SPC** and should be captured at the rising edge of **SPC**.

Both the read register and write register commands are completed in 16 clock pulses or in multiples of 8 in case of multiple read/write bytes. Bit duration is the time between two falling edges of **SPC**. The first bit (bit 0) starts at the first falling edge of **SPC** after the falling edge of **CS** while the last bit (bit 15, bit 23, ...) starts at the last falling edge of **SPC** just before the rising edge of **CS**.

bit 0: RW bit. When 0, the data DI(7:0) is written into the device. When 1, the data DO(7:0) from the device is read. In the latter case, the chip drives **SDO** at the start of bit 8.

bit 1-7: address AD(6:0). This is the address field of the indexed register.

bit 8-15: data DI(7:0) (write mode). This is the data that is written into the device (MSb first).

bit 8-15: data DO(7:0) (read mode). This is the data that is read from the device (MSb first).

In multiple read/write commands further blocks of 8 clock periods are added. When the CTRL3_C (12h) (IF_INC) bit is 0, the address used to read/write data remains the same for every block. When the CTRL3_C (12h) (IF_INC) bit is 1, the address used to read/write data is increased at every block.

The function and the behavior of **SDI** and **SDO** remain unchanged.

5.1.2.1 SPI read
Figure 10. SPI read protocol (in mode 3)

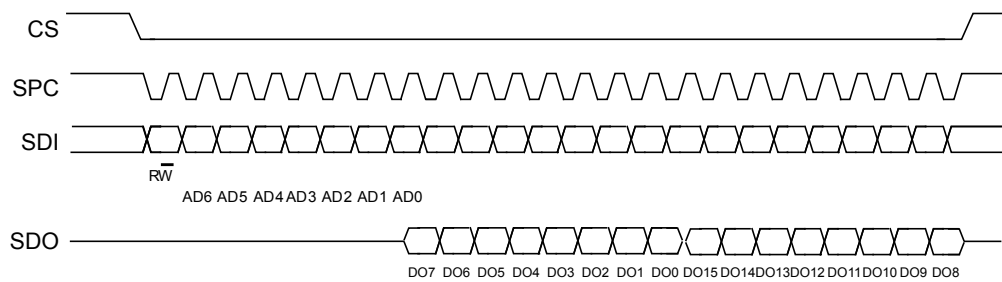

The SPI read command is performed with 16 clock pulses. A multiple byte read command is performed by adding blocks of 8 clock pulses to the previous one.

bit 0: READ bit. The value is 1.

bit 1-7: address AD(6:0). This is the address field of the indexed register.

bit 8-15: data DO(7:0) (read mode). This is the data that is read from the device (MSb first).

bit 16-...: data DO(...-8). Further data in multiple byte reads.

5.1.2.2 SPI write
Figure 12. SPI write protocol (in mode 3)

The SPI write command is performed with 16 clock pulses. A multiple byte write command is performed by adding blocks of 8 clock pulses to the previous one.

bit 0: WRITE bit. The value is 0.

bit 1-7: address AD(6:0). This is the address field of the indexed register.

bit 8-15: data DI(7:0) (write mode). This is the data that is written inside the device (MSb first).

bit 16-... : data DI(...-8). Further data in multiple byte writes.

Figure 13. Multiple byte SPI write protocol (2-byte example) (in mode 3)

5.1.2.3 SPI read in 3-wire mode

A 3-wire mode is entered by setting the CTRL3_C (12h) (SIM) bit equal to 1 (SPI serial interface mode selection).

Figure 14. SPI read protocol in 3-wire mode (in mode 3)

The SPI read command is performed with 16 clock pulses:

bit 0: READ bit. The value is 1.

bit 1-7: address AD(6:0). This is the address field of the indexed register.

bit 8-15: data DO(7:0) (read mode). This is the data that is read from the device (MSb first).

A multiple read command is also available in 3-wire mode.

5.2 MIPI I3CSM interface

5.2.1 MIPI I3CSM slave interface

The ASM330LHB interface includes a MIPI I3CSM SDR only slave interface with MIPI I3CSM SDR embedded features:

- CCC command
- Direct CCC communication (SET and GET)
- Broadcast CCC communication
- Private communications
- Private read and write for single byte
- Multiple read and write
- Error detection and recovery methods

Refer to [Section 5.3 I²C/I3C coexistence in ASM330LHB](#) for details concerning the choice of the interface when powering up the device.

5.2.2 MIPI I3CSM CCC supported commands

The list of MIPI I3CSM CCC commands supported by the device is detailed in the following table.

Table 16. MIPI I3CSM CCC commands

Command	Command code	Default	Description
ENTDAA	0x07		DAA procedure
SETDASA	0x87		Assign dynamic address using static address 0x6B/0x6A depending on SDO pin
ENEC	0x80 / 0x00		Slave activity control (direct and broadcast)
DISEC	0x81/ 0x01		Slave activity control (direct and broadcast)
ENTAS0	0x82 / 0x02		Enter activity state (direct and broadcast)
ENTAS1	0x83 / 0x03		Enter activity state (direct and broadcast)
ENTAS2	0x84 / 0x04		Enter activity state (direct and broadcast)
ENTAS3	0x85 / 0x05		Enter activity state (direct and broadcast)
RSTDAA	0x86 / 0x06		Reset the assigned dynamic address (direct and broadcast)
SETMWL	0x89 / 0x08		Define maximum write length during private write (direct and broadcast)
SETMRL	0x8A / 0x09		Define maximum read length during private read (direct and broadcast)
SETNEWDA	0x88		Change dynamic address
GETMWL	0x8B	0x00 0x08 (2 byte)	Get maximum write length during private write
GETMRL	0x8C	0x00 0x10 0x09 (3 byte)	Get maximum read length during private read
GETPID	0x8D	0x02 0x08 0x00 0x6B 0x10 0x0B	Device ID register
GETBCR	0x8E	0x07 (1 byte)	Bus characteristics register
GETDCR	0x8F	0x00	MIPI I3C SM device characteristics register
GETSTATUS	0x90	0x00 0x00 (2 byte)	Status register
GETMXDS	0x94	0x00 0x38 (2 byte)	Return max data speed ⁽¹⁾

1. Bits[5:3] are set to "111" which indicates that T_{sco} is greater than 12 nsec. To calculate the effective bus frequency, T_{sco} should be used together with line capacitance, number of slaves and stubs (if present).

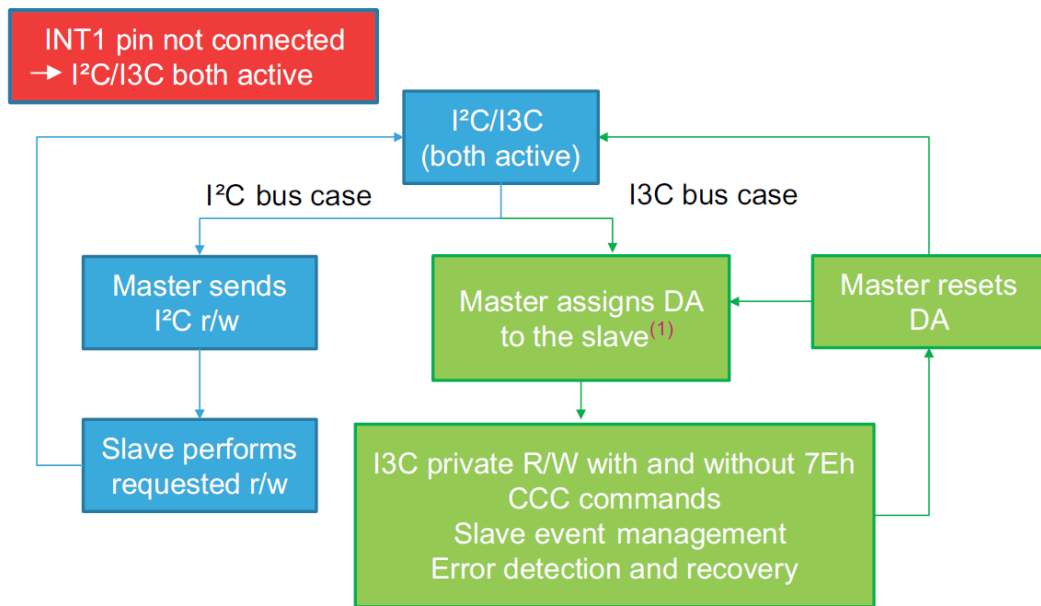

5.3 I²C/I³C coexistence in ASM330LHB

In the ASM330LHB, the SDA and SCL lines are common to both I²C and I³C. The I²C bus requires anti-spike filters on the SDA and SCL pins that are not compatible with I³C timing.

The device can be connected to both I²C and I³C or only to the I³C bus depending on the connection of the INT1 pin when the device is powered up:

- INT1 pin floating (internal pull-down): I²C/I³C both active, see Figure 15
- INT1 pin connected to Vdd_IO: only I³C active, see Figure 16

Figure 15. I²C and I³C both active (INT1 pin not connected)

1. Address assignment (DAA or ENTDA) must be performed with I²C fast mode plus timing. When the slave is addressed, the I²C slave is disabled and the timing is compatible with I³C specifications.

Figure 16. Only I³C active (INT1 pin connected to Vdd_IO)

1. When the slave is I³C only, the I²C slave is always disabled. The address can be assigned using I³C SDR timing.

6 Functionality

6.1 Operating modes

In the ASM330LHB, the accelerometer and the gyroscope can be turned on/off independently of each other and are allowed to have different ODRs and power modes.

The ASM330LHB has three operating modes available:

- Only accelerometer active and gyroscope in power-down or sleep mode
- Only gyroscope active and accelerometer in power-down
- Both accelerometer and gyroscope sensors active with independent ODR

The accelerometer is activated from power-down by writing ODR_XL[3:0] in [CTRL1_XL \(10h\)](#) while the gyroscope is activated from power-down by writing ODR_G[3:0] in [CTRL2_G \(11h\)](#). For combo mode the ODRs are totally independent.

Note: If the accelerometer is to be activated in high-performance operating mode while the gyroscope is already running (that is, the gyroscope is not in power-down mode), proceed as follows:

1. Disable the accelerometer high-performance operating mode (set the XL_HM_MODE bit to 1 in the [CTRL6_C \(15h\)](#) register).
2. Write the [CTRL1_XL \(10h\)](#) register to 50h.
3. Read the [OUTZ_H_A \(2Dh\)](#) register to clear the XLDA bit in the [STATUS_REG \(1Eh\)](#) register.
4. Wait for 1/ODR_XL time period or wait until the XLDA bit in the [STATUS_REG \(1Eh\)](#) register becomes equal to 1.
5. Enable the accelerometer high-performance operating mode (set the XL_HM_MODE bit to 0 in the [CTRL6_C \(15h\)](#) register).
6. Write the [CTRL1_XL \(10h\)](#) register to the desired value.

6.2 Gyroscope power modes

In the ASM330LHB, the gyroscope can be configured in two different operating modes: low-power and high-performance mode. The operating mode selected depends on the value of the G_HM_MODE bit in [CTRL7_G \(16h\)](#). If G_HM_MODE is set to 0, high-performance mode is valid for all ODRs (from 12.5 Hz up to 1.67 kHz).

To enable low-power mode, the G_HM_MODE bit has to be set to 1. Low-power mode is available for ODRs equal to 12.5 Hz, 26 Hz, 52 Hz, 104 Hz and 208 Hz.

6.3 Accelerometer power modes

In the ASM330LHB, the accelerometer can be configured in two different operating modes: low-power and high-performance mode. The operating mode selected depends on the value of the XL_HM_MODE bit in [CTRL6_C \(15h\)](#). If XL_HM_MODE is set to 0, high-performance mode is valid for all ODRs (from 12.5 Hz up to 1.67 kHz).

To enable low-power mode, the XL_HM_MODE bit has to be set to 1. Low-power mode is available for ODRs equal to 1.6 Hz, 12.5 Hz, 26 Hz, 52 Hz, 104 Hz and 208 Hz.

6.4 Block diagram of filters

Figure 17. Block diagram of filters

6.4.1 Block diagram of the gyroscope filter

The gyroscope filtering chain appears below.

Figure 18. Gyroscope filtering chain

The gyroscope ODR is selectable from 12.5 Hz up to 1.67 kHz. A low-pass filter (LPF1) is available, for more details about the filter characteristics see [Table 58. Gyroscope LPF1 bandwidth selection](#). The digital LPF2 filter cannot be configured by the user and its cutoff frequency depends on the selected gyroscope ODR, as indicated in the following table.

Data can be acquired from the output registers and FIFO.

Table 17. Gyroscope LPF2 bandwidth selection

Gyroscope ODR [Hz]	LPF2 cutoff [Hz]
12.5	4.3
26	8.3
52	16.7
104	33
208	67
417	133
833	267
1667	539

6.4.2 Block diagrams of the accelerometer filters

In the ASM330LHB, the filtering chain for the accelerometer part is composed of the following:

- Digital filter (LPF1)
- Composite filter

Details of the block diagram appear in the following figure.

Figure 19. Accelerometer chain

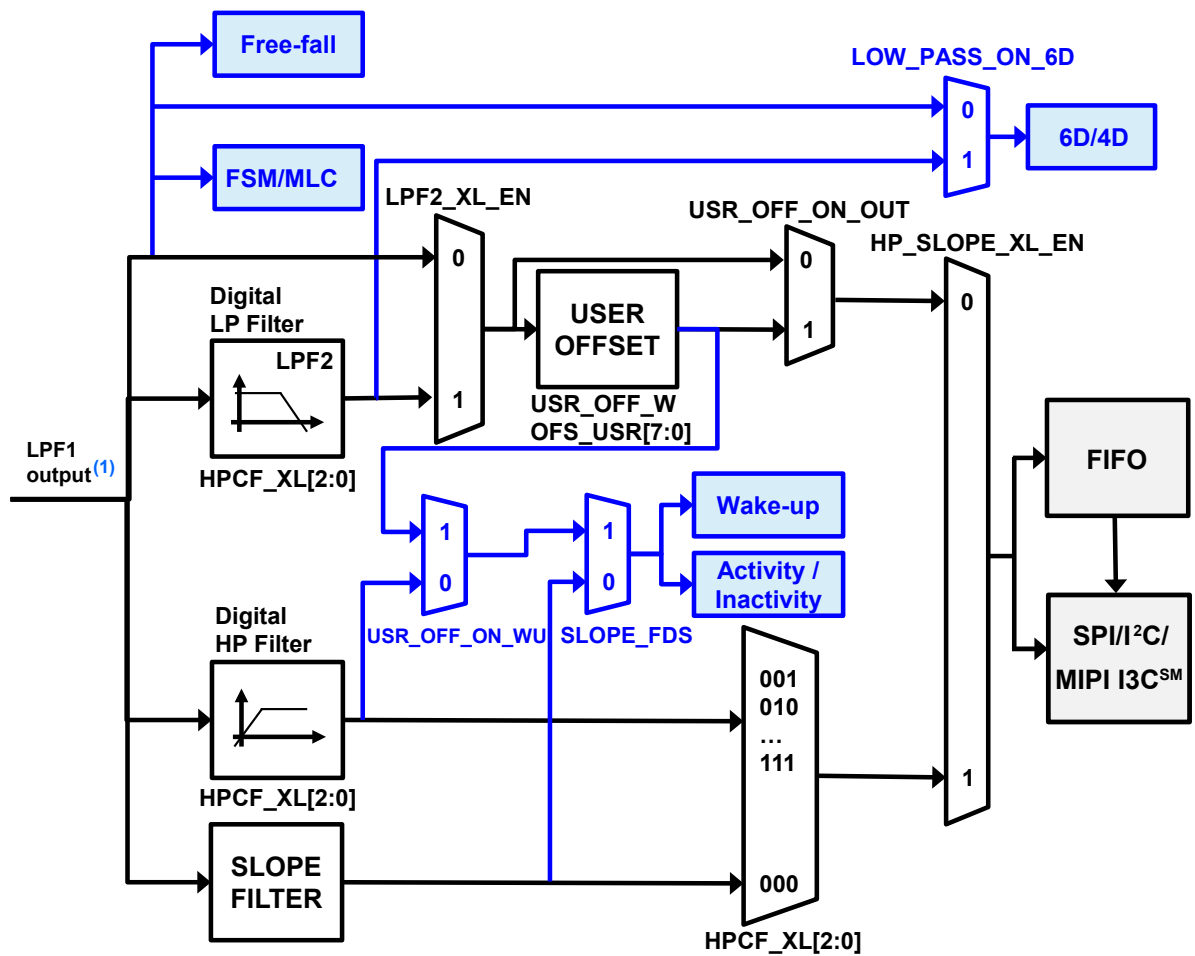

Figure 20. Accelerometer composite filter

1. The cutoff value of the LPF1 output is $ODR/2$ when the accelerometer is in high-performance mode and ODR up to 833 Hz. This value is equal to 780 Hz when the accelerometer is in low-power mode.

6.5 FIFO

The presence of a FIFO allows consistent power saving for the system since the host processor does not need continuously poll data from the sensor, but it can wake up only when needed and burst the significant data out from the FIFO.

The ASM330LHB embeds 3 KB of data in FIFO to store the following data:

- Gyroscope
- Accelerometer
- Timestamp
- Temperature

Writing data in the FIFO is triggered by the accelerometer / gyroscope data-ready signal.

The applications have maximum flexibility in choosing the rate of batching for physical sensors with FIFO-dedicated configurations: accelerometer, gyroscope and temperature sensor batch rates can be selected by the user. It is possible to select decimation for timestamp batching in FIFO with a factor of 1, 8, or 32.

The reconstruction of a FIFO stream is a simple task thanks to the FIFO_DATA_OUT_TAG byte that allows recognizing the meaning of a word in FIFO.

FIFO allows correct reconstruction of the timestamp information for each sensor stored in FIFO. If a change in the ODR or BDR (batch data rate) configuration is performed, the application can correctly reconstruct the timestamp and know exactly when the change was applied without disabling FIFO batching. FIFO stores information of the new configuration and timestamp in which the change was applied in the device.

The programmable FIFO watermark threshold can be set in FIFO_CTRL1 (07h) and FIFO_CTRL2 (08h) using the WTM[8:0] bits. To monitor the FIFO status, dedicated registers (FIFO_STATUS1 (3Ah), FIFO_STATUS2 (3Bh)) can be read to detect FIFO overrun events, FIFO full status, FIFO empty status, FIFO watermark status and the number of unread samples stored in the FIFO. To generate dedicated interrupts on the INT1 and INT2 pins of these status events, the configuration can be set in INT1_CTRL (0Dh) and INT2_CTRL (0Eh).

The FIFO buffer can be configured according to six different modes:

- Bypass mode
- FIFO mode
- Continuous mode
- Continuous-to-FIFO mode
- Bypass-to-continuous mode
- Bypass-to-FIFO mode

Each mode is selected by the FIFO_MODE_[2:0] bits in the FIFO_CTRL4 (0Ah) register.

6.5.1 Bypass mode

In bypass mode (FIFO_CTRL4 (0Ah)(FIFO_MODE_[2:0] = 000), the FIFO is not operational and it remains empty. Bypass mode is also used to reset the FIFO when in FIFO mode.

6.5.2 FIFO mode

In FIFO mode (**FIFO_CTRL4 (0Ah)**(**FIFO_MODE_[2:0] = 001**) data from the output channels are stored in the FIFO until it is full.

To reset FIFO content, bypass mode should be selected by writing **FIFO_CTRL4 (0Ah)**(**FIFO_MODE_[2:0]**) to 000. After this reset command, it is possible to restart FIFO mode by writing **FIFO_CTRL4 (0Ah)** (**FIFO_MODE_[2:0]**) to 001.

The FIFO buffer memorizes up to 3 KB of data but the depth of the FIFO can be resized by setting the **WTM[8:0]** bits in **FIFO_CTRL1 (07h)** and **FIFO_CTRL2 (08h)**. If the **STOP_ON_WTM** bit in **FIFO_CTRL2 (08h)** is set to 1, FIFO depth is limited up to the **WTM[8:0]** bits in **FIFO_CTRL1 (07h)** and **FIFO_CTRL2 (08h)**.

6.5.3 Continuous mode

Continuous mode (**FIFO_CTRL4 (0Ah)**(**FIFO_MODE_[2:0] = 110**) provides a continuous FIFO update: as new data arrives, the older data is discarded.

A FIFO threshold flag **FIFO_STATUS2 (3Bh)**(**FIFO_WTM_IA**) is asserted when the number of unread samples in FIFO is greater than or equal to **FIFO_CTRL1 (07h)** and **FIFO_CTRL2 (08h)** (**WTM[8:0]**).

It is possible to route the **FIFO_WTM_IA** flag to the **INT1** pin by writing in register **INT1_CTRL (0Dh)** (**INT1_FIFO_TH**) = 1 or to the **INT2** pin by writing in register **INT2_CTRL (0Eh)**(**INT2_FIFO_TH**) = 1.

A full-flag interrupt can be enabled, **INT1_CTRL (0Dh)**(**INT1_FIFO_FULL**) = 1 or **INT2_CTRL (0Eh)** (**INT2_FIFO_FULL**) = 1, in order to indicate FIFO saturation and eventually read its content all at once.

If an overrun occurs, at least one of the oldest samples in FIFO has been overwritten and the **FIFO_OVR_IA** flag in **FIFO_STATUS2 (3Bh)** is asserted.

In order to empty the FIFO before it is full, it is also possible to pull from FIFO the number of unread samples available in **FIFO_STATUS1 (3Ah)** and **FIFO_STATUS2 (3Bh)**(**DIFF_FIFO_[9:0]**).

6.5.4 Continuous-to-FIFO mode

In continuous-to-FIFO mode (**FIFO_CTRL4 (0Ah)**(**FIFO_MODE_[2:0] = 011**), FIFO behavior changes according to the trigger event detected in one of the following interrupt events:

- Wake-up
- Free-fall
- D6D

When the selected trigger bit is equal to 1, FIFO operates in FIFO mode.

When the selected trigger bit is equal to 0, FIFO operates in continuous mode.

6.5.5 Bypass-to-continuous mode

In bypass-to-continuous mode (**FIFO_CTRL4 (0Ah)**(**FIFO_MODE_[2:0] = 100**), data measurement storage inside FIFO operates in continuous mode when selected triggers are equal to 1, otherwise FIFO content is reset (bypass mode).

FIFO behavior changes according to the trigger event detected in one of the following interrupt events:

- Wake-up
- Free-fall
- D6D

6.5.6 Bypass-to-FIFO mode

In bypass-to-FIFO mode (**FIFO_CTRL4 (0Ah)**(**FIFO_MODE_[2:0] = 111**), data measurement storage inside FIFO operates in FIFO mode when selected triggers are equal to 1, otherwise FIFO content is reset (bypass mode).

FIFO behavior changes according to the trigger event detected in one of the following interrupt events:

- Wake-up
- Free-fall
- D6D

6.5.7 FIFO reading procedure

The data stored in FIFO are accessible from dedicated registers and each FIFO word is composed of 7 bytes: one tag byte (`FIFO_DATA_OUT_TAG` (78h)), in order to identify the sensor, and 6 bytes of fixed data (`FIFO_DATA_OUT` registers from (79h) to (7Eh)).

The `DIFF_FIFO_[9:0]` field in the `FIFO_STATUS1` (3Ah) and `FIFO_STATUS2` (3Bh) registers contains the number of words (1 byte TAG + 6 bytes DATA) collected in FIFO.

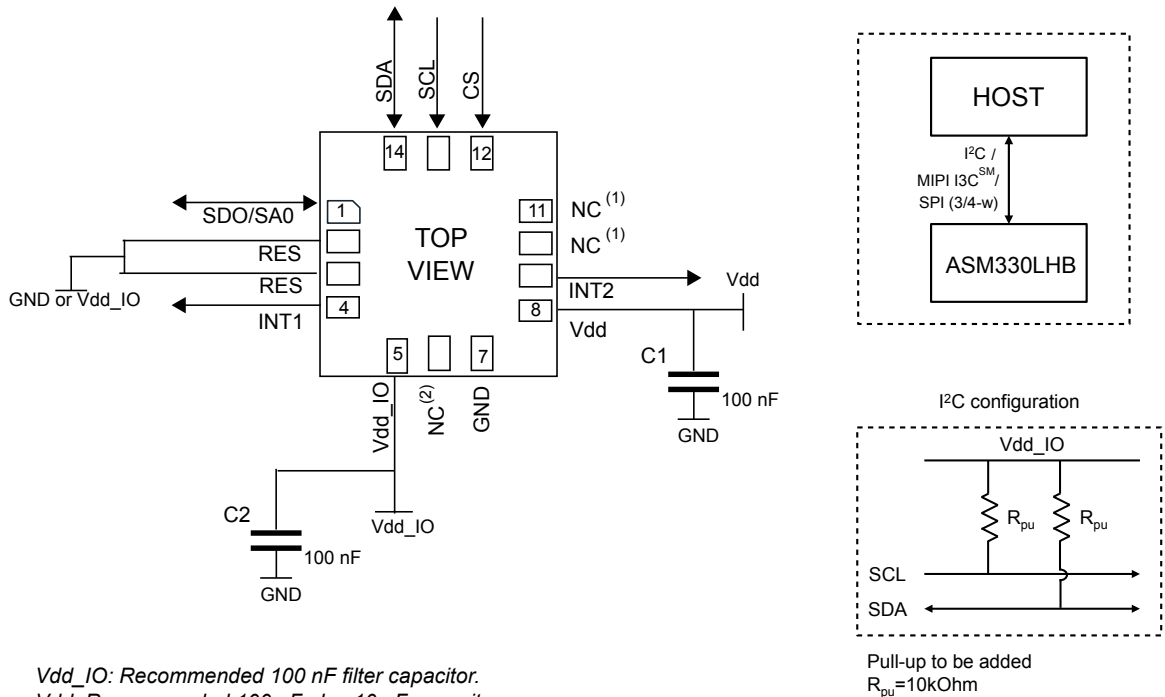

In addition, it is possible to configure a counter of the batch events of accelerometer or gyroscope sensors. The flag `COUNTER_BDR_IA` in `FIFO_STATUS2` (3Bh) alerts that the counter reaches a selectable threshold (`CNT_BDR_TH_[10:0]` field in `COUNTER_BDR_REG1` (0Bh) and `COUNTER_BDR_REG2` (0Ch)). This allows triggering the reading of FIFO with the desired latency of one single sensor. The sensor is selectable using the `TRIG_COUNTER_BDR` bit in `COUNTER_BDR_REG1` (0Bh). As for the other FIFO status events, the flag `COUNTER_BDR_IA` can be routed to the INT1 or INT2 pins by asserting the corresponding bits (`INT1_CNT_BDR` of `INT1_CTRL` (0Dh) and `INT2_CNT_BDR` of `INT2_CTRL` (0Eh)).

Meta information about accelerometer and gyroscope sensor configuration changes can be managed by enabling the `ODR_CHG_EN` bit in `FIFO_CTRL2` (08h).

7 Application hints

7.1 ASM330LHB electrical connections

Figure 21. ASM330LHB electrical connections

1. Leave pin electrically unconnected and soldered to PCB.
2. Connect to Vdd_IO or GND or leave unconnected and soldered to PCB.

The device core is supplied through the Vdd line. Power supply decoupling capacitors (C1, C2 = 100 nF ceramic) should be placed as near as possible to the supply pin of the device (common design practice).

The functionality of the device and the measured acceleration/angular rate data is selectable and accessible through the SPI/I²C/MIPI I3CSM primary interface.

The functions, the threshold and the timing of the two interrupt pins for each sensor can be completely programmed by the user through the SPI/I²C/MIPI I3CSM primary interface.

Table 18. Internal pin status

Pin #	Name	Pin function	Pin status
1	SDO	SPI 4-wire interface serial data output (SDO)	Default: input without pull-up Pull-up is enabled if bit SDO_PU_EN = 1 in register PIN_CTRL (02h).

13	SCL	I ² C/MIPI I3C SM serial clock (SCL) / SPI serial port clock (SPC)	Default: input without pull-up
14	SDA	I ² C/MIPI I3C SM serial data (SDA) / SPI serial data input (SDI) / 3-wire interface serial data output (SDO)	Default: input without pull-up

1. INT1 must be set to 0 or left unconnected during power-on if the I²C/SPI interfaces are used.

Internal pull-up value is from 30 kΩ to 50 kΩ, depending on Vdd_IO.

Note:

The procedure to enable the pull-up on pins 2 and 3 is as follows:

1. From the primary I²C/I3C/SPI interface: write 40h in register at address 01h
2. From the primary I²C/I3C/SPI interface: write 08h in register at address 14h (enable the pull-up on pins 2 and 3)
3. From the primary I²C/I3C/SPI interface: write 00h in register at address 01h

Reserved registers must not be changed. Writing to those registers may cause permanent damage to the device. The content of the registers that are loaded at boot should not be changed. They contain the factory calibration values. Their content is automatically restored when the device is powered up.

9 Register description

The device contains a set of registers which are used to control its behavior and to retrieve linear acceleration, angular rate and temperature data. The register addresses, made up of 7 bits, are used to identify them and to write data through the serial interface.

dataready_pulsed	Enables pulsed data-ready mode (0: data-ready latched mode (returns to 0 only after an interface reading) (default); 1: data-ready pulsed mode (the data ready pulses are 75 µs long)
RST_COUNTER_BDR	Resets the internal counter of batch events for a single sensor. This bit is automatically reset to zero if it was set to 1.
TRIG_COUNTER_BDR	Selects the trigger for the internal counter of batch events between the accelerometer and gyroscope. (0: accelerometer batch event; 1: gyroscope batch event)
CNT_BDR_TH_[10:8]	In conjunction with CNT_BDR_TH_[7:0] in COUNTER_BDR_REG2 (0Ch) , sets the threshold for the internal counter of batch events. When this counter reaches the threshold, the counter is reset and the COUNTER_BDR_IA flag in FIFO_STATUS2 (3Bh) is set to 1.

9.9 INT1_CTRL (0Dh)

INT1 pin control register (R/W)

Each bit in this register enables a signal to be carried over INT1 when the MIPI I3CSM dynamic address is not assigned (I²C or SPI is used). Some bits can also be used to trigger an IBI (in-band interrupt) when the MIPI I3CSM interface is used. The output of the pad is the OR combination of the signals selected here and in register MD1_CFG (5Eh).

DEN_DRDY_flag	Sends DEN_DRDY (DEN stamped on sensor data flag) to the INT1 pin.
INT1_CNT_BDR	Enables COUNTER_BDR_IA interrupt on the INT1.
INT1_FIFO_FULL	Enables FIFO full flag interrupt on the INT1 pin. It can also be used to trigger an IBI when the MIPI I3C SM interface is used.
INT1_FIFO_OVR	Enables FIFO overrun interrupt on the INT1 pin. It can also be used to trigger an IBI when the MIPI I3C SM interface is used.
INT1_FIFO_TH	Enables FIFO threshold interrupt on the INT1 pin. It can also be used to trigger an IBI when the MIPI I3C SM interface is used.
INT1_BOOT	Enables boot status on the INT1 pin.
INT1_DRDY_G	Enables gyroscope data-ready interrupt on the INT1 pin. It can also be used to trigger an IBI when the MIPI I3C SM interface is used.
INT1_DRDY_XL	Enables accelerometer data-ready interrupt on the INT1 pin. It can also be used to trigger an IBI when the MIPI I3C SM interface is used.

9.10 INT2_CTRL (0Eh)

INT2 pin control register (R/W)

Each bit in this register enables a signal to be carried over INT2 when the MIPI I3CSM dynamic address is not assigned (I²C or SPI is used). Some bits can also be used to trigger an IBI when the MIPI I3CSM interface is used. The output of the pad is the OR combination of the signals selected here and in register MD2_CFG (5Fh).

INT2_FIFO_OVR	Enables FIFO overrun interrupt on the INT2 pin.
INT2_FIFO_TH	Enables FIFO threshold interrupt on the INT2 pin.
INT2_DRDY_TEMP	Enables temperature sensor data-ready interrupt on the INT2 pin. It can also be used to trigger an IBI when the MIPI I3C SM interface is used and INT2_ON_INT1 = 1 in CTRL4_C (13h).
INT2_DRDY_G	Enables gyroscope data-ready interrupt on the INT2 pin.
INT2_DRDY_XL	Enables accelerometer data-ready interrupt on the INT2 pin.

-----------	---------	--------	--------	------------------	------------------	----------------	------------------

1. This bit must be set to 0 for the correct operation of the device.

G_HM_MODE	Disables high-performance operating mode for gyroscope. Default: 0 (0: high-performance operating mode enabled; 1: high-performance operating mode disabled)
HP_EN_G	Enables gyroscope digital high-pass filter. The filter is enabled only if the gyroscope is in HP mode. Default value: 0 (0: HPF disabled; 1: HPF enabled)
HPM_G[1:0]	Gyroscope digital HP filter cutoff selection. Default: 00 (00: 16 mHz; 01: 65 mHz; 10: 260 mHz; 11: 1.04 Hz)
USR_OFF_ON_OUT	Enables accelerometer user offset correction block; it's valid for the low-pass path - see Figure 20 . Default value: 0 (0: accelerometer user offset correction block bypassed; 1: accelerometer user offset correction block enabled)

1. This bit must be set to 0 for the correct operation of the device.

HPCF_XL[2:0]	Accelerometer LPF2 and HP filter configuration and cutoff setting. Refer to Table 61 .
HP_REF_MODE_XL	Enables accelerometer high-pass filter reference mode (valid for high-pass path - HP_SLOPE_XL_EN bit must be 1). Default value: 0 ⁽¹⁾ (0: disabled, 1: enabled)
FASTSETTL_MODE_XL	Enables accelerometer LPF2 and HPF fast-settling mode. The filter sets the second samples after writing this bit. Active only during device exit from power-down mode. Default value: 0 (0: disabled, 1: enabled)
HP_SLOPE_XL_EN	Accelerometer slope filter / high-pass filter selection. Refer to Figure 22 .
LOW_PASS_ON_6D	LPF2 on 6D function selection. Refer to Figure 22 . Default value: 0 (0: ODR/2 low-pass filtered data sent to 6D interrupt function; 1: LPF2 output data sent to 6D interrupt function)

1. When enabled, the first output data have to be discarded.

I3C_Bus_Avb_Sel[1:0]	<p>These bits are used to select the bus available time when I3C IBI is used.</p> <p>Default value: 00</p> <p>(00: bus available time equal to 50 μs (default);</p> <p>01: bus available time equal to 2 μs;</p> <p>10: bus available time equal to 1 ms;</p> <p>11: bus available time equal to 25 ms)</p>
PD_DIS_INT1	<p>This bit allows disabling the INT1 pull-down.</p> <p>(0: Pull-down on INT1 enabled (pull-down is effectively connected only when no interrupts are routed to the INT1 pin or when the I3C dynamic address is assigned);</p> <p>1: Pull-down on INT1 disabled (pull-down not connected))</p>

Note: *The IBI (in-band interrupt) is continuously generated (each time a bus available condition is satisfied) until an interrupt is served. The master should execute the interrupt service routine (ISR) at a time lower than the configured bus available time, otherwise the master should disable the interrupt (I3C DISEC in order to disable the interrupt request) at a time lower than the bus available time.*

If the master needs more time to analyze and start the correct ISR, then the master can change the bus available time from 50 μ s (default) to a higher time.

9.49 INTERNAL_FREQ_FINE (63h)

Internal frequency register (R)

FREQ_FINE[7:0]	Difference in percentage of the effective ODR (and timestamp rate) with respect to the typical. Step: 0.15%. 8-bit format, two's complement.
----------------	--

The formula below can be used to calculate a better estimation of the actual ODR:

$$\text{ODR_Actual} = (6667 + ((0.0015 * \text{INTERNAL_FREQ_FINE}) * 6667)) / \text{ODR_Coeff}$$

Selected_ODR	ODR_Coeff

26	256
52	128
104	64
208	32
416	16
833	8
1667	4

The Selected_ODR parameter has to be derived from the ODR_XL selection ([Table 42. CTRL1_XL register description](#)) in order to estimate the accelerometer ODR and from the ODR_G selection ([Table 45. CTRL2_G register description](#)) in order to estimate the gyroscope ODR.

12 Embedded advanced features

The following table provides a list of the registers for the embedded advanced features page 1. These registers are accessible when PAGE_SEL[3:0] are set to 0001 in PAGE_SEL (02h).

Table 247. Register address map - embedded advanced features page 1

Name	Type	Register address		Default	Comment
		Hex	Binary		
FSM_LC_TIMEOUT_L	R/W	7A	01111010	00000000	
FSM_LC_TIMEOUT_H	R/W	7B	01111011	00000000	
FSM_PROGRAMS	R/W	7C	01111100	00000000	
FSM_START_ADD_L	R/W	7E	01111110	00000000	
FSM_START_ADD_H	R/W	7F	01111111	00000000	

Reserved registers must not be changed. Writing to those registers may cause permanent damage to the device. The content of the registers that are loaded at boot should not be changed. They contain the factory calibration values. Their content is automatically restored when the device is powered up.

Write procedure example:

Example: write value 01h in register at address 7Ch (FSM_PROGRAMS) in page 1

1. Write bit FUNC_CFG_EN = 1 in FUNC_CFG_ACCESS (01h) // Enable access to embedded functions registers
2. Write bit PAGE_WRITE = 1 in PAGE_RW (17h) // Select write operation mode
3. Write 0001 in the PAGE_SEL[3:0] field of PAGE_SEL (02h) // Select page 1
4. Write 7Ch in PAGE_ADDRESS (08h) // Set address
5. Write 01h in PAGE_VALUE (09h) // Set value to be written
6. Write bit PAGE_WRITE = 0 in PAGE_RW (17h) // Write operation disabled
7. Write bit FUNC_CFG_EN = 0 in FUNC_CFG_ACCESS (01h) // Disable access to embedded functions registers

Read procedure example:

Example: read value of register at address 7Ch (FSM_PROGRAMS) in page 1

1. Write bit FUNC_CFG_EN = 1 in FUNC_CFG_ACCESS (01h) // Enable access to embedded functions registers
2. Write bit PAGE_READ = 1 in PAGE_RW (17h) // Select read operation mode
3. Write 0001 in the PAGE_SEL[3:0] field of PAGE_SEL (02h) // Select page 1
4. Write 7Ch in PAGE_ADDRESS (08h) // Set address
5. Read value of PAGE_VALUE (09h) // Get register value
6. Write bit PAGE_READ = 0 in PAGE_RW (17h) // Read operation disabled
7. Write bit FUNC_CFG_EN = 0 in FUNC_CFG_ACCESS (01h) // Disable access to embedded functions registers

Note:

Steps 1 and 2 of both procedures are intended to be performed at the beginning of the procedure. Steps 6 and 7 of both procedures are intended to be performed at the end of the procedure. If the procedure involves multiple operations, only steps 3, 4 and 5 must be repeated for each operation. If, in particular, the multiple operations involve consecutive registers, only step 5 can be performed.

13.1 Page 1 - Embedded advanced features registers

13.1.1 FSM_LC_TIMEOUT_L (7Ah) and FSM_LC_TIMEOUT_H (7Bh)

FSM long counter timeout register (R/W)

The long counter timeout value is an unsigned integer value (16-bit format). When the long counter value reaches this value, the FSM generates an interrupt.

14 Soldering information

The LGA package is compliant with the [ECOPACK](#) and RoHS standard.

It is qualified for soldering heat resistance according to JEDEC J-STD-020.

For land pattern and soldering recommendations, consult technical note [TN0018](#) available on www.st.com.

15 Package information

In order to meet environmental requirements, ST offers these devices in different grades of **ECOPACK** packages, depending on their level of environmental compliance. ECOPACK specifications, grade definitions and product status are available at: www.st.com. ECOPACK is an ST trademark.
